## Read/Write Circuit

### Description

The HA16689MP is a low-noise, 8-channel read/write circuit for use with small hard disk drives, with a built-in head damping resistance.

### Functions

- Read amplifier
- Write driver
- Write fault detector
- Fixed write current select

### Features

- Two-power supply design (+5 V and +12 V)
- Easily extended for systems with more than 8 channels
- Low-noise read amplifier with differential gain of 200 (typ)
- Emitter follower fixed current read amplifier output
- Write current can be selected using an external resistor
- Built-in power supply monitor for both 5 V and 12 V prevents incorrect writes
- TTL-compatible interface
- Compact surface-mount package
- Symmetrical arrangement of head input/output and controller signal/pins
- Built-in head damping resistance (750  $\Omega$  typ)

## Pin Descriptions

Symbol	Pin No.	Name	Function
RDX	35	Read amplifier output	Differential output for a pre-amplifier. Outputs amplified read signal from the head coil.
RDY	36		
R/W	39	R/W select	Selects head coil bias for read/write. When R/W is low, write mode is selected; when it is high, read mode is selected.
CD	40	Chip disable	CD input can be used as a chip select for systems requiring more than 8 channels. CD low selects the chip. CD high disables it.
VCT	23	Center tap voltage output	Head center tap voltage output. In write mode, outputs a current proportional to the write current.
RCT	24	Power supply for center tap	Power consumption can be reduced by connecting RCT to V12 through 130 $\Omega$ (1/2 W) resistor. When power consumption is not a concern, RCT can be tied directly to V12.
HS0	34	Head select 0	Head select signal inputs. Selects from head channels 0 to 7 (see table 1).
HS1	33	Head select 1	
HS2	32	Head select 2	
H0X, H0Y	1, 2	Head 0X, 0Y	Channel 0 head coil input/output
H1X, H1Y	4, 5	Head 1X, 1Y	Channel 1 head coil input/output
H2X, H2Y	7, 8	Head 2X, 2Y	Channel 2 head coil input/output
H3X, H3Y	10, 11	Head 3X, 3Y	Channel 3 head coil input/output
H4X, H4Y	12, 13	Head 4X, 4Y	Channel 4 head coil input/output
H5X, H5Y	15, 16	Head 5X, 5Y	Channel 5 head coil input/output
H6X, H6Y	18, 19	Head 6X, 6Y	Channel 6 head coil input/output
H7X, H7Y	21, 22	Head 7X, 7Y	Channel 7 head coil input/output
WC	38	Write current select	The write current can be selected by connecting resistor (R <sub>WC</sub> ) between this pin and GND as shown below.  WRITE CURRENT = K/R <sub>WC</sub> [A] (Equation 1)
WDI	30	Write data input	The write data signal is 1/2 frequency divided, then fed to a write driver.
WUS	29	Write fault detector output	WUS goes high when a write fault is detected. Any of the following will cause WUS to go high:  1. Head coil is shorted to ground or open-circuited 2. Center tap is open-circuited 3. WDI input frequency is too low 4. There is no write current 5. Chip is in read mode 6. Chip is not selected
V5	31	5 V power supply	Digital power supply.
V12	26	12 V power supply	Analog power supply
HGND	44	Head ground	Ground for head coil input/outputs.
AGND	41	Analog ground	Analog ground
DGND	28	Digital ground	Digital ground.
WCGND	37	WC ground	Ground for fixed write current source.

**Absolute Maximum Ratings (Ta = 25°C)**

Parameter	Symbol	Rating	Unit	Pins
Digital power supply voltage	V <sub>5</sub>	6.0	V	V5
Analog power supply voltage	V <sub>12</sub>	14.0	V	V12
Write current	I <sub>W</sub>	60	mA	
Input voltage	V <sub>in</sub>	-0.3 to V <sub>5</sub> + 0.3	V	HS0, HS1, HS2, WDI, R/W, CD
WUS voltage	V <sub>WUS</sub>	14.0	V	WUS
WUS output current	I <sub>WUS</sub>	12	mA	WUS
Center tap output current	I <sub>co</sub>	-60	mA	VCT
Read data output current	I <sub>ro</sub>	-10	mA	RDX, RDY
Head voltage	V <sub>h</sub>	-0.3 to 14	V	H0X, H0Y to H7X, H7Y
Operating temperature	T <sub>opr</sub>	0 to +70	°C	
Storage temperature	T <sub>stg</sub>	-55 to +125	°C	

The absolute maximum ratings are limiting values, to be applied individually, beyond which the device may be permanently damaged. Functional operation under any of these conditions is not guaranteed. Exposing a circuit to its absolute maximum rating for extended periods of time may affect the device's reliability.

**Electrical Characteristics (V<sub>12</sub> = 12 V, V<sub>5</sub> = 5 V, Ta = 25°C, unless otherwise specified)****Power Supply**

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
Power supply voltage	V <sub>5</sub>	4.5	5.0	5.5	V	
	V <sub>12</sub>	10.8	12.0	13.2	V	
+5 V power supply current	I <sub>5</sub>	—	—	25	mA	Read mode
	I <sub>5</sub>	—	—	30	mA	Write mode
	I <sub>5</sub>	—	—	20	mA	Idle mode
+12 V power supply current	I <sub>12</sub>	—	—	35	mA	Read mode
	I <sub>12</sub>	—	—	20 + I <sub>W</sub>	mA	Write mode
	I <sub>12</sub>	—	—	20	mA	Idle mode

**Digital Inputs**

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
Input low voltage	V <sub>IL</sub>	-0.3	—	0.8	V	
Input low current	I <sub>IL</sub>	-400	—	—	µA	V <sub>IL</sub> = 0.8 V (applies to WDI)
	I <sub>IL</sub>	-100	—	—	µA	V <sub>IL</sub> = 0.8 V (applies to HS0, HS1, HS2, CD, and R/W)
Input high voltage	V <sub>IH</sub>	2.0	—	V <sub>5</sub> + 0.3	V	
Input high current	I <sub>IH</sub>	—	—	100	µA	V <sub>IH</sub> = 2.0 V
Read/write transition time	t <sub>rw</sub>	—	—	600	ns	R/W to 90% VCT write voltage
Write/read transition time	t <sub>wr</sub>	—	—	600	ns	R/W to 90% VCT read voltage
Head select delay	t <sub>hs</sub>	—	—	600	ns	Read or write mode
Chip disable delay	t <sub>rw</sub>	—	—	600	ns	R/W to Idle or Idle to R/W

**Write Fault Detector**

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
US low voltage	V <sub>OL</sub>	—	—	0.5	V	I <sub>OL</sub> = 8 mA
US high current	I <sub>OH</sub>	—	—	100	µA	V <sub>OH</sub> = 5.0 V
Fault to no-fault delay	t <sub>d2</sub>	—	—	1.0	µs	
No-fault to fault delay	t <sub>d1</sub>	1.6	—	8.0	µs	

# HA16689MP

## Read Amplifiers

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
Differential voltage gain	A <sub>vd</sub>	170	200	230	V/V	f = 300 kHz
Bandwidth (-3 dB)	B <sub>W</sub>	—	20	—	MHz	
Input noise voltage	V <sub>n</sub>	—	1.5	—	nV/√Hz	f ≤ 15 MHz, Input shorted
Input bias current	I <sub>b</sub>	—	—	35	μA	Read mode
Common mode rejection ratio	CMRR	50	—	—	dB	V <sub>in</sub> (C <sub>m</sub> ) = V <sub>CT</sub> + 100 mV <sub>p-p</sub> , 0.0 VDC, f = 5 MHz
Supply voltage rejection ratio	PSRR	45	—	—	dB	V <sub>S</sub> , V <sub>12</sub> ± 100 mV <sub>p-p</sub> , f = 5 MHz
Channel separation	Sep	45	—	—	dB	V <sub>in</sub> = 100 mV <sub>p-p</sub> on unselected channels and V <sub>in</sub> = 0 mV <sub>p-p</sub> on selected channel, f = 1 MHz
Output offset voltage	V <sub>o</sub>	-600	—	600	mV	Input shorted
Differential input impedance	R <sub>in</sub>	570	750	930	Ω	f = 300 kHz
	R <sub>in</sub>	—	500	—	Ω	f = 5 MHz
Common mode output voltage	V <sub>o</sub> Cm	5.0	6.0	7.5	V	
Output source current	I <sub>ORD</sub>	—	-10	—	mA	
Output sink current	I <sub>OSRD</sub>	1.5	2.2	—	mA	

## Write Drivers

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions
Write current select range	I <sub>W</sub>	10	—	50	mA	I <sub>W</sub> Head > 200 mA μH
Head current rise time	T <sub>HCX</sub>	—	—	20	ns	L <sub>H</sub> = 0 μH, R <sub>H</sub> = 0 Ω, 10% to 90% point
Head current switching delay time	T <sub>d3</sub>	—	—	25	ns	R <sub>H</sub> = 0 Ω, L <sub>H</sub> = 0 μH, From 50% point
Head current switching symmetry	T <sub>d4</sub>	—	—	2	ns	WDI duty cycle = 50% rise/fall time = 1 ns
WDI minimum input frequency	F <sub>w</sub>	125	—	—	kHz	WUS = Low
Head current gain	I <sub>h</sub> /I <sub>WC</sub>	—	20	—		Head current I <sub>WC</sub>
VCT output voltage	V <sub>CT</sub>	3.8	4.3	5.0	V	Read mode I <sub>b</sub> = -35 μA
	V <sub>CT</sub>	5.0	6.0	6.6	V	Write mode I <sub>WC</sub> = -45 mA
Write current select coefficient	K	131	140	149	V	

Table 1 Head Select

HS2	HS1	HS0	Head Select
Low	Low	Low	0
Low	Low	High	1
Low	High	Low	2
Low	High	High	3
High	Low	Low	4
High	Low	High	5
High	High	Low	6
High	High	High	7

Table 2 Mode Select

CD	R/W	Mode
Low	Low	Write
Low	High	Read
High	Low	Idle
High	High	Idle
