

NN518125 series EDO (Hyper Page) Mode CMOS 128K × 8bit Dynamic RAM

NPNX

DESCRIPTION

The NN518125 series is a high performance CMOS Dynamic Random Access Memory organized as 131,072 words by 8-bits. The NN518125 series is fabricated with advanced CMOS technology and designed with innovative design techniques resulting in high speed, extremely low power and wide operating margins at both component and system levels.

The NN518125 series features an EDO (Hyper page) mode operation in which a high speed read, write or read-write is performed on any column address along a row address.

An extremely short row address capture time and an asynchronous column address decoder relax the timing constraints associated with address multiplexing.

Refresh is accomplished by performing $\overline{\text{RAS}}$ only refresh cycles, hidden refresh cycles, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles, or normal read or write cycles on the 512 address combinations of A0 to A8 during a 8 ms period.

Multiplexed address inputs permit the NN518125 series to be packaged in a standard 26-pin plastic SOJ. The package sizes provide high system bit densities and are compatible with widely available automated testing and insertion equipment. System level features include single power supply of 5V $\pm 10\%$ tolerance and direct interface with high performance TTL logic families.

FEATURES

- 131,072 × 8 bit Organization
- Single 5V $\pm 10\%$ Power Supply
- Performance Ranges

Parameter	-45	-50	-60	-70
Max. $\overline{\text{RAS}}$ Access Time (t_{RAC})	45ns	50ns	60ns	70ns
Max. $\overline{\text{CAS}}$ Access Time (t_{CAC})	15ns	15ns	15ns	20ns
Max. Column Address Access Time (t_{AA})	23ns	25ns	30ns	35ns
Min. Read/Write Cycle Time (t_{RC})	90ns	90ns	110ns	130ns

- EDO (Hyper Page) Mode Operation
- Low Power Operation
Low Standby Current (CMOS level inputs)
 - Standard 1mA
 - L version 50 μ A
- 512 Refresh Cycles
 - Standard distributed across 8ms
 - L version distributed across 32ms
- Self Refresh Mode (L version)
- All inputs/Outputs and Clocks fully TTL and CMOS compatible
- Refresh Modes
 - $\overline{\text{RAS}}$ only
 - $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$
 - Hidden Refresh
- High Reliability Packages
Plastic 26pin SOJ (P26/24SJ-2A)

9005650 0001413 T03

PIN CONFIGURATION (TOP VIEW)

26/24-pin SOJ (300 mil)
P26/24SJ-2A

PIN NAMES

A0~A8	Address Inputs
$\overline{\text{RAS}}$	Row Address Strobe
$\overline{\text{CAS}}$	Column Address Strobe
$\overline{\text{OE}}$	Output Enable
I/O1~I/O8	Data-in / Data-out
$\overline{\text{WE}}$	Write Enable
V _{CC}	+5V Supply
V _{SS}	Ground
NC	No Connection

FUNCTIONAL BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS

RATING	SYMBOL	VALUE	UNIT
Voltage on Any Pin Relative to V_{SS}	V_{in}, V_{out}	-1 to 7	V
Voltage on V_{CC} Relative to V_{SS}	V_{CC}	-1 to 7	V
Storage Temperature (Plastic)	T_{stg}	-55 to +125	°C
Power Dissipation	P_d	1.0	W
Ambient Operating Temperature	T_a	0 to +70	°C
Short Circuit Output Current	I_{out}	50	mA

Permanent device damage can occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods can affect device reliability.

DC OPERATING CONDITIONS

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
V_{CC}	Supply Voltage	4.5	5.0	5.5	V
V_{SS}	Supply Voltage	0	0	0	V
V_{IH}	Input High Voltage, All Inputs	2.4	—	6.5	V
V_{IL}	Input Low Voltage, All Inputs	-1.0	—	0.8	V

Note: All voltage values in this data sheet are with respect to V_{SS} unless otherwise specified.

9005650 0001415 886

DC ELECTRICAL CHARACTERISTICS (0°C ≤ Ta ≤ 70°C, V_{CC} = 5.0V ±10%)

9005650 0001418 595

Notes:

3. Eight Initialization Cycles are required following a 200μs pause after Power Up. These Initialization Cycles may consist of any combination of the following : $\overline{\text{RAS}}$ only refresh Cycles, Read Cycles, Write Cycles. $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh Cycles.
4. AC measurements assume $t_T=3\text{ns}$. All AC parameters are measured with $V_{IL}(\text{min.}) \geq V_{SS}$ and $V_{IH}(\text{max.}) \leq V_{CC}$ and with a load equivalent to two TTL loads and 50pF.(-50/-60/-70) / one TTL loads and 50pF.(-45)
5. $V_{IH}(\text{min.})$ and $V_{IL}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
6. Operation within the $t_{RCD}(\text{max.})$ limit ensures that $t_{RAC}(\text{max.})$ can be met. $t_{RCD}(\text{max.})$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
7. Operation within the $t_{RAD}(\text{max.})$ limit ensures that $t_{RAC}(\text{max.})$ can be met. $t_{RAD}(\text{max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\text{max.})$ limit, then access time is controlled by t_{AA} .
8. Assumes three state test load (5pF and a 220 ohm to 1.3V Thevenin equivalent).
9. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
10. $t_{OFF}(\text{max.})$ defines the time at which the output achieves an open circuit condition and is not referenced to output voltage levels. t_{OFF} only applies when $\overline{\text{RAS}}$ is high.
11. t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}(\text{min.})$, the cycle is an early write cycle and data-out pins will remain open circuit (high impedance) throughout the entire cycle. If $t_{RWD} \geq t_{RWD}(\text{min.})$, $t_{CWD} \geq t_{CWD}(\text{min.})$ and $t_{AWD} \geq t_{AWD}(\text{min.})$, the cycle is a read-modify-write cycle and the data-out will contain data read from the selected cell. If neither of the above conditions is satisfied, the condition of the data-out (at access time) is indeterminate.
12. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in read-modify-write cycles.
13. Access time is determined by the longer of t_{AA} , t_{CAC} , or t_{CPA} .
14. $t_{ASC} \geq t_{CP}$ to achieve $t_{PC}(\text{min.})$ and $t_{CPA}(\text{max.})$ values.
15. $t_{REF}=32\text{msec}$ for Long Refresh version (L version).
16. t_{OFR} applies only when $\overline{\text{CAS}}$ is high.

SELF REFRESH MODE

■ The NN518125 (L version) has a Self Refresh Mode.

a. Entering the Self Refresh Mode:

The NN518125L Self Refresh Mode is entered by using $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ cycle with $\overline{\text{WE}}$ " high " and holding $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ signal " low " longer than 300 μ s.

b. Continuing the Self Refresh Mode:

The Self Refresh Mode is continued by holding $\overline{\text{RAS}}$ " low " after entering the Self Refresh Mode.

It does not depend on $\overline{\text{CAS}}$ being " high " or " low " after entering the Self Refresh Mode for to continue the Self Refresh Mode.

c. Exiting the Self Refresh Mode:

The NN518125L exits the Self Refresh Mode when the $\overline{\text{RAS}}$ signal is brought " high ".
