

NN5116400B / NN5117400B series **Fast Page Mode** **CMOS 4M × 4bit Dynamic RAM**

DESCRIPTION

The NN5116400B / NN5117400B series is a high performance CMOS Dynamic Random Access Memory organized as 4,194,304 words by 4 bits. The NN5116400B / NN5117400B series is fabricated with advanced CMOS technology and designed with innovative design techniques resulting in high speed, extremely low power and wide operating margins at both component and system levels.

The NN5116400B / NN5117400B series features a high speed page mode operation in which a high speed read, write or read-write is performed on any column address along a row address.

An extremely short row address capture time and an asynchronous column address decoder relax the timing constraints associated with address multiplexing.

The outputs are tri-stated by $\overline{\text{CAS}}$ which, in essence, acts as an output enable independent of $\overline{\text{RAS}}$ with very fast $\overline{\text{CAS}}$ to output access time.

Refresh is accomplished by performing $\overline{\text{RAS}}$ only refresh cycles, hidden refresh cycles, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycles, or normal read or write cycles on the 4,096 address combinations of A0 to A11 during a 64 ms period for the NN5117400A series. (2,048 address combinations of A0 to A10 during a 32 ms period for the NN5117400B series.)

Multiplexed address inputs permit The NN5116400B / NN5117400B series to be packaged in a standard 26-pin plastic SOJ, 26 pin TSOP TYPE II. The package sizes provide high system bit densities and are compatible with widely available automated testing and insertion equipment. System level features include single power supply of 5V ±10% tolerance and direct interface with high performance TTL logic families.

FEATURES

- 4,194,304 × 4 bit Organization
- Single 5V ±10% Power Supply
- Performance Ranges

Parameter	-40	-50	-60
Max. $\overline{\text{RAS}}$ Access Time (t_{RAC})	40ns	50ns	60ns
Max. $\overline{\text{CAS}}$ Access Time (t_{CAC})	11ns	13ns	15ns
Max. Column Address Access Time (t_{AA})	20ns	25ns	30ns
Min. Read/Write Cycle Time (t_{RC})	80ns	90ns	110ns

- Fast Page Mode Operation
- Low Power Operation
 - Low Standby Current (CMOS level inputs)
 - Standard 1mA
 - L version 150μA
- NN5116400B : 4,096 Refresh Cycles
 NN5117400B* : 2,048 Refresh Cycles
 - Standard distributed across 64ms/32ms*
 - L version distributed across 128ms
- All inputs/Outputs and Clocks
 fully TTL and CMOS compatible
- Refresh Modes
 - $\overline{\text{RAS}}$ only
 - $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$
 - Hidden Refresh
- 16bit Parallel Test Mode
- High Reliability Packages
 - Plastic 26pin SOJ (P26/24SJ-2A-L)
 - Plastic 26pin TSOP TYPE II (P26/24TP-2A-L)

PIN NAMES

A0 - A11	Address Inputs (NOTE)
RAS	Row Address Strobe
CAS	Column Address Strobe
OE	Output Enable
I/O1~I/O4	Data-In / Data-out
WE	Write Enable
V _{CC}	+5V Supply
V _{SS}	Ground

FUNCTIONAL BLOCK DIAGRAM

NOTE

	Address / Row Address	ColumnAddress
NN5116400B	A0 - A11	A0 - A9
NN5117400B	A0 - A10	A0 - A10

ABSOLUTE MAXIMUM RATINGS

RATING	SYMBOL	VALUE	UNIT
Voltage on Any Pin Relative to V _{SS}	V _{in} , V _{out}	-1 to 7	V
Voltage on V _{CC} Relative to V _{SS}	V _{CC}	-1 to 7	V
Storage Temperature (Plastic)	T _{stg}	-55 to +125	°C
Power Dissipation	P _d	1.0	W
Ambient Operating Temperature	T _a	0 to +70.	°C
Short Circuit Output Current	I _{out}	50	mA

Permanent device damage can occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods can affect device reliability.

DC OPERATING CONDITIONS

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
V _{CC}	Supply Voltage	4.5	5.0	5.5	V
V _{SS}	Supply Voltage	0	0	0	V
V _{IH}	Input High Voltage, All Inputs	2.4	—	6.5	V
V _{IL}	Input Low Voltage, All Inputs	-1.0	—	0.8	V

Note: All voltage values in this data sheet are with respect to V_{SS} unless otherwise specified.

Notes:

- Eight Initialization Cycles are required following a 200 μ s pause after Power Up. These Initialization Cycles may consist of one of the following : RAS only refresh Cycles, Read Cycles, Write Cycles, CAS before RAS refresh Cycles.
- AC measurements assume $t_T=2$ ns.
- $V_{IH}(\text{min.})$ and $V_{IL}(\text{max.})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
- Operation within the $t_{RCD}(\text{max.})$ limit ensures that $t_{RAC}(\text{max.})$ can be met. $t_{RCD}(\text{max.})$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
- Operation within the $t_{RAD}(\text{max.})$ limit ensures that $t_{RAC}(\text{max.})$ can be met. $t_{RAD}(\text{max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\text{max.})$ limit, then access time is controlled by t_{AA} .
- Assumes three state test load (5pF and a 220 ohm to 1.3V Thevenin equivalent).
- Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
- $t_{OFF}(\text{max.})$ defines the time at which the output achieves an open circuit condition and is not referenced to output voltage levels.
- t_{WCS} , t_{RWD} , t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}(\text{min.})$, the cycle is an early write cycle and data-out pins will remain open circuit (high impedance) throughout the entire cycle. If $t_{RWD} \geq t_{RWD}(\text{min.})$, $t_{CWD} \geq t_{CWD}(\text{min.})$ and $t_{AWD} \geq t_{AWD}(\text{min.})$, the cycle is a read-modify-write cycle and the data-out will contain data read from the selected cell. If neither of the above conditions is satisfied, the condition of the data-out (at access time) is indeterminate.
- These parameters are referenced to CAS leading edge in early write cycles and to WE leading edge in read-modify-write cycles.
- Access time is determined by the longer of t_{AA} , t_{CAC} , or t_{CPA} .
- $t_{ASC} \geq t_{CP}$ to achieve $t_{PC}(\text{min.})$ and $t_{CPA}(\text{max.})$ values.
- $t_{REF}=128$ msec for Long Refresh version (L version).

TEST MODE SET CYCLE ($\overline{\text{WE}}$, $\overline{\text{CAS}}$ BEFORE $\overline{\text{RAS}}$ REFRESH CYCLE)

NOTE : TEST MODE ADDRESS KEY

A5 and A6 must be "High".
A4 and A7 must be "Low".
All other address are "Don't care".

 : High or Low

Address A0 - A11 : NN5116400B
A0 - A10 : NN5117400B

■ The NN5116400B / NN5117400B has a 16 bit parallel Test Mode Function for reducing test time. In the Test Mode, memory configuration is 1M x 16 bits and the Column address A0 and A1 address is ignored.

- Entering the test mode:
The NN5116400B / NN5117400B test mode is entered by using the test mode set cycle ($\overline{\text{WE}}$, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ cycle).
- Read/Write operation in test mode:
For Write cycle, data input from each I/O (I/O1~I/O4) is written to 4 bit memory cells (total 16bits) at the same time. During the read cycle, if the 4 bits of data are equal then a "1" is output from each I/O. If there is a difference in the read data for a given 4 bit combination, a "0" will be output from that I/O.
- Exiting the test mode:
The NN5116400B / NN5117400B will exit the test mode by either a $\overline{\text{RAS}}$ only refresh cycle or a $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycle width $\overline{\text{WE}}$ "high".
- Refresh during test mode:
During test mode refresh must be executed by a normal Read cycle or a $\overline{\text{WE}}$, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh cycle.

SELF REFRESH MODE

NOTE

Address A0 - A11 : NN5116400B
A0 - A10 : NN5117400B

: High or Low

■ The NN5116400BL / NN5117400BL version has a Self Refresh Mode.

a. Entering the Self Refresh Mode:

The NN5116400BL / NN5117400BL Self Refresh Mode is entered by using $\overline{CAS}$ before $\overline{RAS}$ cycle with $\overline{WE}$ "high" and holding RAS and CAS signal "low" longer than 300 μ s.

b. Continuing the Self Refresh Mode:

The Self Refresh Mode is continued by holding $\overline{RAS}$ "low" after entering the Self Refresh Mode.

It does not depend on $\overline{CAS}$ being "high" or "low" after entering the Self Refresh Mode for to continue the Self Refresh Mode.

c. Exiting the Self Refresh Mode:

The NN5116400BL / NN5117400BL exits the Self Refresh Mode when the $\overline{RAS}$ signal is brought "high".
