Delay characteristics @ $V_{cc} = 5.0V$ and $T_a = 25^\circ C$, no load.
 Delay time measured at 1.5V level.
 Rise time measured @ 0.8V to 2.0V levels.
 For minimum input pulse width, contact factory.

TTL Programmable Delay Modules—Gull Wing

TTL Programmable Delay Modules—Low Profile Gull Wing

For delay adjustments via BCD programming. Simplifies minor adjustments and adds flexibility. Although indicated below that programmable modules are available up to 3-bit, 6-bit delay modules are available through a simple combination of cascaded modules.

- ▶ Available in new .125" height package.
- ▶ 3-bit binary (1, 2, 4) programming gives 7 equal step delays.
- ▶ Low on \bar{E} enables output.
- ▶ Complementary output available.
- ▶ Available in 11 step delays from 1 to 15 ns.
- ▶ Low inherent delay from:
 - Input to output = 6.0 ± 1.5 ns
 - Input to output = 3.0 ± 1.5 ns
 - E to output = 10.0 ns Maximum
 - Sn to output = 13.0 ns Maximum

- ▶ Transfer molded packaging—for highest reliability.
- ▶ Supports Schottky TTL, FAST, and FACT logics.
- ▶ Specifications here are for Schottky TTL only; contact factory for other logic specifications.
- ▶ MX suffix designated military models with temperature range -55° to $+125^\circ C$ and ceramic package IC screened to Mil-Std-883C and 38510.
- ▶ Military models as "MX" above, but with in-house burn-in and thermal shock, add suffix "MY".
- ▶ Designed for leading edge timing.

Notes
 Only the pins specified in the schematics are provided with each package.
 Pin numbers shown are for reference only and are not necessarily marked on unit.
 Lead material is electro tin plated (alloy 42) or solder dipped.
 All specifications are subject to change without notice.
