

TriQuint's GA1087 is a configurable clock buffer which generates 11 outputs, operating over a wide range of frequencies — from 24 MHz to 105 MHz. The outputs are available at either 1x and 2x or at 1x and $\frac{1}{2}$ x the reference clock frequency, f_{REF} . When one of the Group A outputs (Q5–Q10) is used as feedback to the PLL, all Group A outputs will be at f_{REF} , and all Group B outputs (Q0–Q4) will be at $\frac{1}{2} \times f_{REF}$. When one of the Group B outputs is used as feedback to the PLL, all Group A outputs will be at $2 \times f_{REF}$ and all Group B outputs will be at f_{REF} .

A very stable internal Phase-Locked Loop (PLL) provides low-jitter operation. Completely self-contained, this PLL requires no external capacitors or resistors. The PLL's voltage-controlled oscillator (VCO) has a frequency range from 280 MHz to 420 MHz. By feeding back one of the output clocks to FBIN, the PLL continuously maintains frequency and phase synchronization between the reference clock (REFCLK) and each of the outputs.

TriQuint's patented output buffer design delivers a very low output-to-output skew of 150 ps (max). The GA1087's symmetrical TTL outputs are capable of sourcing and sinking 30 mA.

GA1087

11-Output Configurable Clock Buffer

Features

- Wide frequency range:
24 MHz to 105 MHz
- Output configurations:
five outputs at f_{REF}
five outputs at $f_{REF}/2$ or
six outputs at $2 \times f_{REF}$
four outputs at f_{REF}
- Low output-to-output skew:
150 ps (max) within a group
- Near-zero propagation delay:
 $-350 \text{ ps} \pm 500 \text{ ps (max)}$ or
 $-350 \text{ ps} \pm 700 \text{ ps (max)}$
- TTL-compatible with 30 mA
output drive
- 28-pin J-lead
surface-mount package

GA1087

Functional Description

The core of the GA1087 is a Phase-Locked Loop (PLL) that continuously compares the reference clock (REFCLK) to the feedback clock (FBIN), maintaining a zero frequency difference between the two. Since one of the outputs (Q0–Q8) is always connected to FBIN, the PLL keeps the propagation delay between the outputs and the reference clock within $-350\text{ ps} \pm 500\text{ ps}$ for the GA1087-MC500, and within $-350\text{ ps} \pm 700\text{ ps}$ for the GA1087-MC700.

The internal voltage-controlled oscillator (VCO) has an operating range of 280 MHz to 420 MHz. The combination of the VCO and the Divide Logic enables the GA1087 to operate between 24 MHz and 105 MHz.

The device features six divide modes: $\div 4$, $\div 5$, $\div 6$, $\div 8$, $\div 10$, and $\div 12$. The Frequency Select pins, F0 and F1,

and the output used as feedback to FBIN set the divide mode as shown in Table 1.

In the test mode, the PLL is bypassed and REFCLK is connected directly to the Divide Logic block via the MUX, as shown in Figure 1. This mode is useful for debug and test purposes. The various test modes are outlined in Table 2. In the test mode, the frequency of the reference clock is divided by 4, 5, or 6.

The maximum rise and fall time at the output pins is 1.4 ns. All outputs of the GA1087 are TTL-compatible with 30 mA symmetric drive and a minimum V_{OH} of 2.4 V.

Power Up/Reset Synchronization

After-power-up or reset, the PLL requires time before it achieves synchronization lock. The maximum time required for synchronization (TSYNC) is 500 ms.

Table 1. Frequency Mode Selection

Feedback: Any Group A Output (Q5 – Q10)

Test	Select Pins		Mode	Reference Clock Frequency Range	Output Frequency Range	
	F0	F1			Group A: Q5–Q10	Group B: Q0–Q4
0	1	0	$\div 4$	70 MHz – 105 MHz	70 MHz – 105 MHz	35 MHz – 52 MHz
0	0	0	$\div 5$	56 MHz – 84 MHz	56 MHz – 84 MHz ¹	28 MHz – 42 MHz
0	0	1	$\div 6$	48 MHz – 70 MHz	48 MHz – 70 MHz	24 MHz – 35 MHz
0	1	1	Not Used	N.A.	N.A.	N.A.

Feedback: Any Group B Output (Q0 – Q4)

Test	Select Pins		Mode	Reference Clock Frequency Range	Output Frequency Range	
	F0	F1			Group A: Q5–Q10	Group B: Q0–Q4
0	1	0	$\div 8$	35 MHz – 52 MHz	70 MHz – 105 MHz	35 MHz – 52 MHz
0	0	0	$\div 10$	28 MHz – 42 MHz	56 MHz – 84 MHz ¹	28 MHz – 42 MHz
0	0	1	$\div 12$	24 MHz – 35 MHz	48 MHz – 70 MHz	24 MHz – 35 MHz
0	1	1	Not Used	N.A.	N.A.	N.A.

Notes: 1. This mode produces outputs with 40/60 duty cycle for Q5 – Q10 only.

Table 2. Test Mode Selection

Test	F0	F1	Mode	Ref. Clock	Group B: Outputs Q0–Q4	Group A: Outputs Q5–Q10
1	1	0	$\div 4$	f_{REF}	$f_{REF} \div 8$	$f_{REF} \div 4$
1	0	0	$\div 5$	f_{REF}	$f_{REF} \div 10$	$f_{REF} \div 5$
1	0	1	$\div 6$	f_{REF}	$f_{REF} \div 12$	$f_{REF} \div 6$
1	1	1	—	—	—	—

Layout Guidelines

Multiple ground and power pins on the GA1087 reduce ground bounce. Good layout techniques, however, are necessary to guarantee proper operation and to meet the specifications across the full operating range. TriQuint recommends bypassing each of the V_{DD} supply pins to the nearest ground pin, as close to the chip as possible.

Figure 2 shows the recommended power layout for the GA1087. The bypass capacitors should be located on the same side of the board as the GA1087. The V_{DD} traces connect to an inner-layer V_{DD} plane. All of the ground pins (GND) are connected to a small ground plane on the surface beneath the chip. Multiple through holes connect this small surface plane to an inner-layer ground plane. The capacitors (C1–C5) are 0.1 mF. TriQuint's test board uses X7R temperature-stable capacitors in 1206 SMD cases.

t_{JR} ⁵	Random Jitter	Figure 4	---	190	400	ps
t_{SYNC} ⁶	Synchronization Time	---	---	10	500	μs

- Notes: 1. All measurements are tested with a REFCLK having a rise time of 0.5 ns (0.8 V to 2.0 V).
2. The PLL maintains alignment of CLK and FBIN at all times. This specification applies to the rising edge only because the input duty cycle can vary.
while the output duty cycle is typically 50/50. The delay t_{PD} is measured at the 1.5 V level between CLK and FBIN.
3. Skew specifies the width of the window in which outputs switch, and is measured at 1.5 V.
4. This specification represents the deviation from 50/50 on the outputs.
5. Jitter specifications refer to peak-to-peak value. t_{JR} is the jitter on the output with respect to the reference clock. t_{JP} is the jitter on the output with respect to the output's previous rising edge.
6. t_{SYNC} is the time required for the PLL to synchronize; this assumes the presence of a CLK signal and a connection from one of the outputs to FBIN.
