

## Features

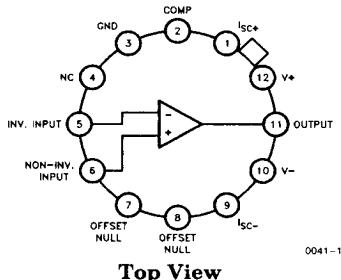

- High output current—200 mA
- Excellent open-loop gain—106 dB
- Low offset voltage—1 mV
- Wide full power bandwidth—20 kHz
- High slew rate—3 V/ $\mu$ s
- MIL-STD-883 devices 100% manufactured in U.S.A.

## General Description

The ELH0041 are general purpose operational amplifiers capable of delivering large output currents not usually associated with conventional IC op amps; the ELH0041 delivers currents of 200 mA at voltage levels closely approaching the available power supplies. In addition, both the inputs and outputs are protected against overload. These devices are compensated with a single external capacitor and are free of any unusual oscillation or latch-up problems.

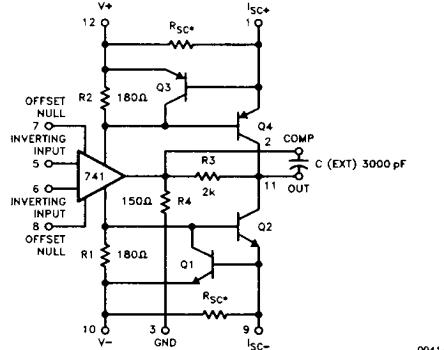

For applications requiring output currents in excess of 1A, see the ELH0021 data sheet.

The excellent input characteristics and high output capability of the ELH0041 make it an ideal choice for power applications such as DC servos, capstan drivers, deflection yoke drivers, and programmable power supplies.

The ELH0041 is particularly suited for applications such as torque drivers for inertial guidance systems, diddle yoke drivers for alphanumeric CRT displays, cable drivers, and programmable power supplies for automatic test equipment.

Elantec facilities comply with MIL-I-45208A and other applicable quality specifications. Elantec's Military devices are 100% fabricated and assembled in our rigidly controlled, ultra-clean facilities in Milpitas, California. For additional information on Elantec's Quality and Reliability Assurance policy and procedures request brochure QRA-1.

#### Important Note:

All parameters having Min/Max specifications are guaranteed. The Test Level column indicates the specific device testing actually performed during production and Quality inspection. Elantec performs most electrical tests using modern high-speed automatic test equipment, specifically the LTX77 Series system. Unless otherwise noted, all tests are pulsed tests, therefore  $T_J = T_C = T_A$ .

Test Level	Test Procedure
I	100% production tested and QA sample tested per QA test plan QCX0002.
II	100% production tested at $T_A = 25^\circ\text{C}$ and QA sample tested at $T_A = 25^\circ\text{C}$ , $T_{MAX}$ and $T_{MIN}$ per QA test plan QCX0002.
III	QA sample tested per QA test plan QCX0002.
IV	Parameter is guaranteed (but not tested) by Design and Characterization Data.
V	Parameter is typical value at $T_A = 25^\circ\text{C}$ for information purposes only.

$P_C$	Power Consumption	$V_{OUT} = 0V$			75	105	I	mW

Note 1: Rating applies for supply voltages above  $\pm 15V$ . For supplies less than  $\pm 15V$ , rating is equal to supply voltage.

Note 2: Rating applies for LH0041G with  $R_{SC} = 0\Omega$ .

Note 3: Rating applies as long as package power rating is not exceeded.

Note 4: Specifications apply for  $\pm 5V \leq V_S \leq 18V$ .

Note 5: The ELH0041, like all Class B amplifiers, has a "dead band" when  $V_{OUT}$  is near zero volts. Typical values for the "dead band" are in the 50  $\mu V$  to 200  $\mu V$  range. Open-loop gain is measured at  $V_{OUT}$  from  $\pm 0.5 V_{DC}$  to  $\pm 10 V_{DC}$  which is out of the range of the "dead band".
