DS96177/μA96177 RS-485/RS-422 Differential Bus Repeater

General Description

The DS96177/μA96177 Differential Bus Repeater is a monolithic integrated device designed for one-way data communication on multipoint bus transmission lines. This device is designed for balanced transmission bus line applications and meets EIA Standard RS-485 and RS-422A. The device is designed to improve the performance of the data communication over long bus lines. The DS96177/μA96177 is an active high Enable.

The DS96177/μA96177 features positive and negative current limiting and TRI-STATE® outputs for the receiver and driver. The receiver features high input impedance, input hysteresis for increased noise immunity, and input sensitivity of 200 mV over a common mode input voltage range of -12V to +12V. The driver features thermal shutdown for protection from line fault conditions. Thermal shutdown is designed to occur at a junction temperature of approximately 160°C. The driver is designed to drive current loads up to 60 mA maximum.

The DS96177/μA96177 is designed for optimum performance when used on transmission buses employing the DS96172/μA96172 and DS96174/μA96174 differential line drivers, DS96173/μA96173 and DS96175/μA96175 differential line receivers, or DS96176/μA96176 differential bus transceivers.

Features

- Meets EIA Standard RS-422A and RS-485
- Designed for multipoint transmission on long bus lines in noisy environments
- TRI-STATE outputs
- Bus voltage range -7.0V to +12V
- Positive and negative current limiting
- Driver output capability ±60 mA max
- Driver thermal shutdown protection
- Receiver input high impedance
- Receiver input sensitivity of ±200 mV
- Receiver input hysteresis of 50 mV typical
- Operates from single 5.0V supply
- Low power requirements

- Note 1:** "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Electrical Characteristics" provide conditions for actual device operation.
- Note 2:** Unless otherwise specified Min/Max limits apply across the 0°C to +70°C range for the DS96177/μA96177. All typicals are given for $V_{CC} = 5V$ and $T_A = 25^\circ C$.
- Note 3:** All currents into the device pins are positive; all currents out of the device pins are negative. All voltages are referenced to ground unless otherwise specified.
- Note 4:** $\Delta[V_{OD}]$ and $\Delta[V_{OC}]$ are the changes in magnitude of V_{OD} , V_{OC} respectively, that occur when the input is changed from a high level to a low level.
- Note 5:** In EIA Standards RS-422A and RS-485, V_{OC} , which is the average of the two output voltages with respect to ground, is called output offset voltage, V_{OS} .
- Note 6:** The algebraic convention, when the less positive (more negative) limit is designated minimum, is used in this data sheet for common mode input voltage and threshold voltage levels only.
- Note 7:** Hysteresis is the difference between the positive-going input threshold voltage, V_{T+} , and the negative going input threshold voltage, V_{T-} .
- Note 8:** Refer to EIA Standards RS-485 for exact conditions.
- Note 9:** Only one output at a time should be shorted.
