

DS3245 Quad MOS Clock Driver

General Description

The DS3245 is a quad bipolar-to-MOS clock driver with TTL compatible inputs. It is designed to provide high output current and voltage capabilities necessary for optimum driving of high capacitance N-channel MOS memory systems.

Only 2 supplies, 5 V_{DC} and 12 V_{DC}, are required without compromising the usual high V_{OH} specification obtained by circuits using a third supply.

The device features 2 common enable inputs, a refresh input, and a clock control input for simplified system designs. The circuit was designed for driving highly capacitive loads at high speeds and uses Schottky-clamped transistors. PNP transistors are used on all inputs, thereby minimizing input loading.

Features

- TTL compatible inputs
- Operates from 2 standard supplies: 5 V_{DC}, 12 V_{DC}
- Internal bootstrap circuit eliminates need for external PNP's
- PNP inputs minimize loading
- High voltage/current outputs
- Input and output clamping diodes
- Control logic optimized for use with MOS memory systems
- Pin and function equivalent to Intel 3245

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The table of "Electrical Characteristics" provides conditions for actual device operation.

Note 2: Unless otherwise specified min/max limits apply across the 0°C to +°C range. All typical values are for $T_A = 25^\circ\text{C}$ and $V_{CC} = 5V$ and $V_{DD} = 12V$.

Note 3: All currents into device pins shown as positive, out of device pins as negative, all voltages referenced to ground unless otherwise noted. All values shown as max or min on absolute value basis.

Switching Characteristics $T_A = 0^\circ\text{C to } +75^\circ\text{C}$, $V_{CC} = 5\text{V} \pm 5\%$, $V_{DD} = 12\text{V} \pm 5\%$
