

DS1812 5V EconoReset with Active High Push-Pull Output

#### www.dalsemi.com

### **FEATURES**

- Automatically restarts a microprocessor after power failure
- Maintains reset for 150 ms after V<sub>CC</sub> returns to an in-tolerance condition
- Reduces need for discrete components
- Precision temperature-compensated voltage reference and voltage sensor
- Low-cost TO-92, or space saving surface mount SOT-23 packages available
- Push-pull active high output
- Operating temperature -40°C to +85°C

#### DESCRIPTION

The DS1812 EconoReset uses a precision temperature reference and comparator circuit to monitor the status of the power supply ( $V_{CC}$ ). When an out-of-tolerance condition is detected, an internal power-fail signal is generated which forces reset to the active state. When  $V_{CC}$  returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 150 ms to allow the power supply and processor to stabilize.

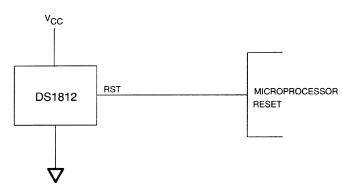

## **OPERATION - POWER MONITOR**

The DS1812 provides the function of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When  $V_{CC}$  is detected as out-of-tolerance, the RST signal is asserted. On power-up, RST is kept active for approximately 150 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before RST is released.

## NOTES:

- 1. All voltages are referenced to ground.
- 2. Measured with  $V_{CC} \ge 2.7$  volts.
- 3. Measured with RST output open.
- 4.  $t_R = 5 \ \mu s$ .
