LT1130 Series

Advanced Low Power 5V RS232 Drivers/Receivers with Charge Pump

FEATURES

- Absolutely No Latchup
- CMOS Comparable Low Power — 80mW
- Operates from a Single 5V Supply
- Superior to CMOS
 - Easy PC Layout — Flow Through Architecture
 - Improved Speed — Operates Over 64K Baud
 - Improved Protection — Outputs Can be Forced to $\pm 30V$ Without Damage
 - Three-State Outputs are High Impedance When Off
 - Only Needs $1\mu F$ Capacitors
 - Output Overvoltage Does Not Force Current Back Into Supplies
- $1\mu A$ Supply Current in Shutdown
- Available in SO Package

DESCRIPTION

The LT1130 Series are the only RS232 drivers/receivers with charge pump to guarantee absolutely no latchup. These interface optimized devices provide a realistic balance between CMOS levels of power dissipation and real world requirements for ruggedness. The driver outputs are fully protected against overload and can be shorted to $\pm 30V$. Unlike CMOS, the advanced architecture of the LT1130 does not load the signal line when "shut down" or when power is off. Both the receiver and RS232 outputs are put into a high impedance state. An advanced output stage allows driving higher capacitive loads at higher speeds with exceptional ruggedness.

For applications requiring only 2 drivers and 2 receivers with charge pump in one package see the LT1180 Series data sheet. All of Linear Technology's RS232 IC's are available in standard surface mount packages.

Supply Leakage Current	SHUTDOWN, $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$		1	100	μA
	SHUTDOWN, $0^\circ\text{C} \leq T_A \leq 70^\circ\text{C}$		1	10	μA
Supply Rise Time	SHUTDOWN To Turn On		2		ms
On/Off Pin Current	SHUTDOWN, $0\text{V} \leq V_{ON/OFF} \leq 5\text{V}$	-15		80	μA

The $\bullet$ denotes the specifications which apply over the full operating temperature range, ($0^\circ\text{C} \leq T_A \leq 70^\circ\text{C}$ for commercial grade, $-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$ for industrial grade, and $-55^\circ\text{C} \leq T_A \leq 125^\circ\text{C}$ for military grade).

Note 1: Testing done at $V_{CC} = 5\text{V}$ and $V_{ON/OFF} = 3\text{V}$

Note 2: $V_{ON/OFF} \leq 0.1\text{V}$

Note 3: For LT1139, 40, and 41 with 12V supplies, V_{OUT} leakage is $200\mu\text{A}$ and V_{OUT} is forced to $\pm 25\text{V}$.

PIN FUNCTIONS

V_{CC} : Input supply pin. Supply current drops to zero in the SHUTDOWN mode.

GND: Ground pin.

On/Off: Controls the operation mode of the device and is TTL/CMOS compatible. A logic low puts the device in the SHUTDOWN mode which reduces input supply current to zero and places both driver and receiver outputs in a high impedance state. A logic high fully enables the device.

V^+ : Positive supply (RS232 drivers). $V^+ \approx 2V_{CC} - 1.5\text{V}$. Requires an external capacitor ($\geq 1\mu\text{F}$) for charge storage. Capacitor may be tied to ground or +5V input supply. V^+ voltage is short circuit proof for 30 seconds. With multiple transceivers, the V^+ and V^- pins may be paralleled into common capacitors.

V^- : Negative supply (RS232 drivers). $V^- \approx -(2V_{CC} - 2.5\text{V})$. Requires an external capacitor ($\geq 1\mu\text{F}$) for charge storage.

Loading does reduce V^- voltage. V^- is short circuit proof for 30 seconds. With multiple transceivers, the V^+ and V^- pins may be paralleled into common capacitors.

DRIVER IN: RS232 driver input pins. Inputs are TTL/CMOS compatible. Inputs should not be allowed to float. Tie unused inputs to V_{CC} .

DRIVER OUT: Driver outputs with RS232 voltage levels. Outputs are in a high impedance state when in the SHUTDOWN mode or when power is off ($V_{CC} = 0\text{V}$) to allow data line sharing. Outputs are fully short circuit protected from $V^- + 30\text{V}$ to $V^+ - 30\text{V}$ with power on, off, or in the SHUTDOWN mode. Typical output breakdowns are greater than $\pm 45\text{V}$ and higher applied voltages will not damage the device if moderately current limited. Although the outputs are protected, short circuits on one output can load the power supply generators disrupting the signal level from other outputs.

10

LT1130 Series

T-75-45-05

RX IN: Receiver inputs. Accepts RS232 voltage levels ($\pm 30V$) and has 0.4V of hysteresis to provide noise immunity. Input impedance is nominally 5k Ω .

RX OUT: Receiver outputs with TTL/CMOS voltage levels. Outputs are in a high impedance state when in the SHUT-DOWN mode to allow data line sharing. Outputs are fully short circuit protected to ground or V_{CC} with power on, off, or in the SHUTDOWN mode.

C1 +; C1 -; C2 +; C2 -: Requires an external capacitor ($\geq 1\mu F$) from C1 + to C1 - and another from C2 + to C2 -. In applications where larger positive voltages are available, such as +12V, C1 can be eliminated and the positive voltage connected directly to the C1 + terminal.

APPLICATION HINTS

The driver output stage of the LT1130 offers significantly improved protection over older bipolar and CMOS designs. In addition to current limiting, the driver output can be externally forced to $\pm 30V$ with no damage or excessive cur-

rent flow, and will not disrupt the supplies. Some drivers have diodes connected between the outputs and the supplies, so externally applied voltages can cause excessive supply voltage to develop.

LT1130 Series

T-75-45-05

APPLICATION HINTS

Placing the LT1130 type device in the SHUTDOWN mode puts both the driver and receiver outputs in a high impedance state. This allows data line sharing and transceiver applications.

The SHUTDOWN mode also drops input supply current to zero for power-conscious systems.

Sharing a Transmitter Line

When driving CMOS logic from a receiver that will be used in the SHUTDOWN mode and there is no other active receiver on the line, a 51k resistor can be placed from the logic input to V_{CC} to force a definite logic level when the receiver output is in a high impedance state.

To protect against receiver input overloads in excess of $\pm 30V$, a voltage clamp can be placed on the data line and still maintain RS232 compatibility.
