8 x 8-bit Parallel Multiplier LMU08/LMU8U

FEATURES

- 35 ns Worst-Case Multiply Time
- Low Power CMOS Technology
- LMU08 Replaces TRW MPY008H
- LMU8U Replaces TRW MPY08HU
- Two's Complement (LMU08), or Unsigned Operands (LMU8U)
- Three-State Outputs
- Available Screened to MIL-STD-883, Class B
- Package Styles Available:
  - 40-pin Plastic DIP
  - 40-pin Sidebraze, Hermetic DIP
  - 44-pin Plastic LCC, J-Lead (LMU08 only)
  - 44-pin Ceramic LCC (Type C)

DESCRIPTION

The **LMU08** and **LMU8U** are 8-bit parallel multipliers which feature high speed with low power consumption. They are pin-for-pin equivalents with TRW MPY08H and MPY008HU type multipliers. Full military ambient temperature range operation is attained by the use of advanced CMOS technology.

Both the LMU08 and the LMU8U produce the 16-bit product of two 8-bit numbers. The LMU08 accepts operands in two's complement format, and produces a two's complement result. The product is provided in two halves with the sign bit replicated as the most significant bit of both halves. This facilitates use of the LMU08 product as a double precision operand in 8-bit systems. The LMU8U operates on unsigned data, producing an unsigned magnitude result.

Both the LMU08 and the LMU8U feature independently controlled registers for both inputs and the product, which along with three-state outputs allows easy interfacing with microprocessor busses. Provision is made in the LMU08 and LMU8U for proper rounding of the product to 8-bit precision. The round input is loaded at the rising edge of the logical OR of CLK A and CLK B for the LMU08. The LMU8U latches RND on the rising edge of CLK A only. In either case, a '1' is added in the most significant position of the lower product byte when RND is asserted. Subsequent truncation of the least significant product byte results in a correctly rounded 8-bit result.

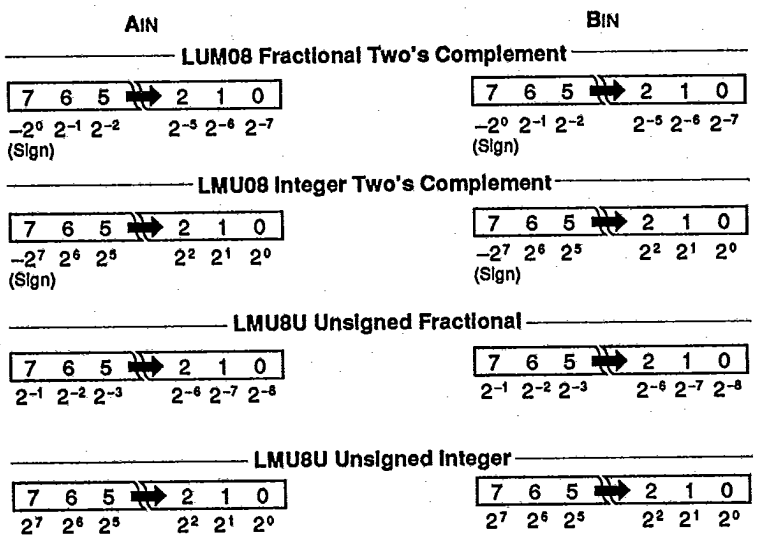
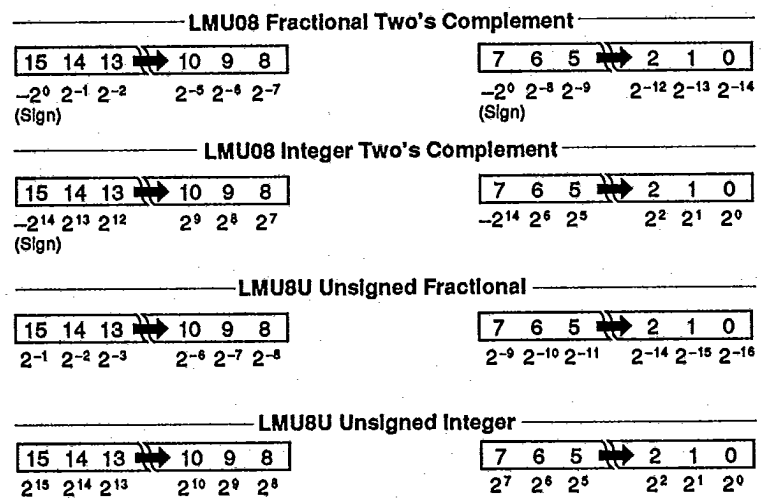
Input Formats



Output Formats



MAXIMUM RATINGS *Above which useful life may be impaired (Notes 1, 2, 3, 8)*

Storage temperature ..... –65°C to +150°C
Operating ambient temperature ..... –55°C to +125°C
Vcc supply voltage with respect to ground ..... –0.5 V to +7.0 V
Input signal with respect to ground ..... –3.0 V to +7.0 V
Signal applied to high impedance output ..... –3.0 V to +7.0 V
Output current into low outputs ..... 25 mA
Latchup current ..... > 400 mA

OPERATING CONDITIONS *To meet specified electrical and switching characteristics*

Mode	Temperature Range (Ambient)	Supply Voltage
Active Operation, Commercial	0°C to +70°C	4.75 V ≤ Vcc ≤ 5.25 V
Active Operation, Military	–55°C to +125°C	4.50 V ≤ Vcc ≤ 5.50 V

5

ELECTRICAL CHARACTERISTICS *Over Operating Conditions*

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
V_{OH}	Output High Voltage	I_{OH} = –2.0 mA	3.5			V
V_{OL}	Output Low Voltage	I_{OL} = 8.0 mA			0.5	V
V_{IH}	Input High Voltage		2.0		Vcc	V
V_{IL}	Input Low Voltage	(Note 3)	0.0		0.8	V
I_{IX}	Input Current	Ground ≤ V_{IN} ≤ Vcc			±20	µA
I_{OZ}	Output Leakage Current	Ground ≤ V_{OUT} ≤ Vcc			±20	µA
I_{OS}	Output Short Current	V_{OUT} = Ground, Vcc = Max (Notes 4, 8)			–250	mA
I_{CC1}	Vcc Current, Dynamic	(Notes 5, 6)		8	24	mA
I_{CC2}	Vcc Current, Quiescent	(Note 7)			1.0	mA

SWITCHING CHARACTERISTICS

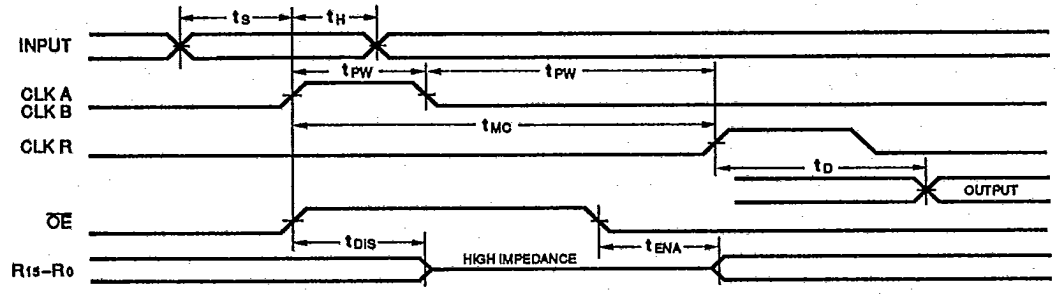
COMMERCIAL OPERATING RANGE (0°C to +70°C) *Notes 9, 10 (ns)*

Symbol	Parameter	LMU08/LMU8U- 70 Min	70 Max	50 Min	50 Max	35 Min	35 Max
t_{MC}	Multiply Time (Clocked)		70		50		35
t_D	Output Delay		25		20		18
t_{ENA}	Output Enable Time (Note 11)		20		18		18
t_{DIS}	Output Disable Time (Note 11)		18		17		17
t_{PW}	Clock Pulse Width	20		20		10	
t_H	Input Register Hold Time	4		0		0	
t_S	Input Register Setup Time	14		14		14	

MILITARY OPERATING RANGE (–55°C to +125°C) *Notes 9, 10 (ns)*

Symbol	Parameter	LMU08/LMU8U- 90 Min	90 Max	60 Min	60 Max	45 Min	45 Max
t_{MC}	Multiply Time (Clocked)		90		60		45
t_D	Output Delay		35		20		20
t_{ENA}	Output Enable Time (Note 11)		35		20		20
t_{DIS}	Output Disable Time (Note 11)		35		18		18
t_{PW}	Clock Pulse Width	25		20		15	
t_H	Input Register Hold Time	5		0		0	
t_S	Input Register Setup Time	20		15		15	

SWITCHING WAVEFORMS



NOTES

1. Maximum Ratings indicate stress specifications only. Functional operation of these products at values beyond those indicated in the Operating Conditions table is not implied. Exposure to maximum rating conditions for extended periods may affect reliability.

2. The products described by this specification include internal circuitry designed to protect the chip from damaging substrate injection currents and accumulations of static charge. Nevertheless, conventional precautions should be observed during storage, handling, and use of these circuits in order to avoid exposure to excessive electrical stress values.

3. This device provides hard clamping of transient undershoot and overshoot. Input levels below ground or above V_{CC} will be clamped beginning at –0.6 V and V_{CC} + 0.6 V. The device can withstand indefinite operation with inputs in the range of –3.0 V to +7.0 V. Device operation will not be adversely affected, however, input current levels will be well in excess of 100 mA.

4. Duration of the output short circuit should not exceed 30 seconds.

5. Supply current for a given application can be accurately approximated by:

$$\frac{NCV^2F}{4}$$

where

N = total number of device outputs
C = capacitive load per output
V = suppy voltage
F = clock frequency

6. Tested with all outputs changing every cycle and no load, at a 5 MHz clock rate.

7. Tested with all inputs within 0.1 V of V_{CC} or Ground, no load.

8. These parameters are guaranteed but not 100% tested.

9. AC specifications tested with input transition times less than 3 ns, output reference levels of 1.5 V (except t_{EN}/t_{DIS} test) and input levels of nominally 0 to 3.0 V. Output loading is a resistive divider which provides for specified I_{OL} and I_{OH} plus 30 pF capacitance.

This device has high speed outputs capable of large instantaneous current pulses and fast turn-on/turn-off times. As a result, care must be exercised in the testing of this device. The following measures are recommended:

a. A 0.1 µF ceramic capacitor should be installed between V_{CC} and Ground leads as close to the Device Under Test (DUT) as possible. Similar capacitors should be installed between device V_{CC} and the tester common, and device ground and tester common.

b. Ground and V_{CC} supply planes must be brought directly to the DUT socket or contactor fingers.

c. Input voltages should be adjusted to compensate for inductive ground and V_{CC} noise to maintain required DUT input levels relative to the DUT ground pin.

10. Each parameter is shown as a minimum or maximum value. Input requirements are specified from the point of view of the external system driving the chip. Setup time, for example, is specified as a minimum since the external system must supply at least that much time to meet the worst-case requirements of all parts. Responses from the internal circuitry are specified from the point of view of the device. Output delay, for example, is specified as a maximum since worst-case operation of any device always provides data within that time.

11. Transition is measured ±200 mV from steady-state voltage with specified loading.
