

## LM6164/LM6264/LM6364 High Speed Operational Amplifier

### General Description

The LM6164 family of high-speed amplifiers exhibits an excellent speed-power product in delivering 300V per  $\mu$ s and 175 MHz GBW (stable down to gains as low as +5) with only 5 mA of supply current. Further power savings and application convenience are possible by taking advantage of the wide dynamic range in operating supply voltage which extends all the way down to +5V.

These amplifiers are built with National's VIP™ (Vertically Integrated PNP) process which produces fast PNP transistors that are true complements to the already fast NPN devices. This advanced junction-isolated process delivers high speed performance without the need for complex and expensive dielectric isolation.

### Features

- High slew rate: 300 V/ $\mu$ s
- High GBW product: 175 MHz
- Low supply current: 5 mA
- Fast settling: 100 ns to 0.1%
- Low differential gain: <0.1%
- Low differential phase: <0.1°
- Wide supply range: 4.75V to 32V
- Stable with unlimited capacitive load

### Applications

- Video amplifier
- Wide-bandwidth signal conditioning
- Radar
- Sonar

### Connection Diagrams

## Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ( $V^+ - V^-$ )	36V
Differential Input Voltage	
(Note 7)	$\pm 8V$
Common-Mode Input Voltage	
(Note 11)	$(V^+ - 0.7V) \text{ to } (V^- + 0.7V)$
Output Short Circuit to Gnd	
(Note 2)	Continuous
Soldering Information	
Dual-In-Line Package (N, J)	
Soldering (10 sec.)	260°C
Small Outline Package (M)	
Vapor Phase (60 sec.)	215°C
Infrared (15 sec.)	220°C

See AN-450 "Surface Mounting Methods and Their Effect on Product Reliability" for other methods of soldering surface mount devices.

Storage Temperature Range	-65°C to +150°C
Max Junction Temperature	
(Note 3)	150°C
ESD Tolerance (Notes 7, 8)	$\pm 700V$

## Operating Ratings

Temperature Range (Note 3)	
LM6164	$-55^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$
LM6264	$-25^\circ\text{C} \leq T_J \leq +85^\circ\text{C}$
LM6364	$0^\circ\text{C} \leq T_J \leq +70^\circ\text{C}$
Supply Voltage Range	4.75V to 32V

**Note 1:** "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits.

## DC Electrical Characteristics

The following specifications apply for Supply Voltage =  $\pm 15V$ ,  $V_{CM} = 0$ ,  $R_L \geq 100 \text{ k}\Omega$  and  $R_S = 50 \Omega$  unless otherwise noted. **Boldface** limits apply for  $T_A = T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_A = T_J = 25^\circ\text{C}$ .

Symbol	Parameter	Conditions	Typ	LM6164	LM6264	LM6364	Units
				Limit (Notes 4, 12)	Limit (Note 4)	Limit (Note 4)	
$V_{OS}$	Input Offset Voltage		2	4 <b>6</b>	4 <b>6</b>	9 <b>11</b>	mV max

## AC Electrical Characteristics

The following specifications apply for Supply Voltage =  $\pm 15\text{V}$ ,  $V_{CM} = 0$ ,  $R_L \geq 100\text{ k}\Omega$  and  $R_S = 50\Omega$  unless otherwise noted. **Boldface** limits apply for  $T_A = T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_A = T_J = 25^\circ\text{C}$ .

Symbol	Parameter	Conditions	Typ	LM6164	LM6264	LM6364	Units
				Limit (Notes 4, 12)	Limit (Note 4)	Limit (Note 4)	
GBW	Gain-Bandwidth Product	F = 20 MHz	175	140 <b>100</b>	140 <b>120</b>	120 <b>100</b>	MHz min
		Supply = $\pm 5\text{V}$	120				
SR	Slew Rate	$A_V = +5$ (Note 9)	300	200 <b>180</b>	200 <b>180</b>	200 <b>180</b>	V/ $\mu\text{s}$ min
		Supply = $\pm 5\text{V}$	200				
PBW	Power Bandwidth	$V_{OUT} = 20\text{ V}_{PP}$	4.5				MHz
$T_S$	Settling Time	10V Step to 0.1% $A_V = -4$ , $R_L = 2\text{ k}\Omega$	100				ns
$\phi_m$	Phase Margin	$A_V = +5$	45				Deg
$A_D$	Differential Gain	NTSC, $A_V = +10$	<0.1				%
$\phi_D$	Differential Phase	NTSC, $A_V = +10$	<0.1				Deg
$e_{np-p}$	Input Noise Voltage	F = 10 kHz	8				nV/ $\sqrt{\text{Hz}}$
$i_{np-p}$	Input Noise Current	F = 10 kHz	1.5				pA/ $\sqrt{\text{Hz}}$

**Note 2:** Continuous short-circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ .

**Note 3:** The typical junction-to-ambient thermal resistance of the molded plastic DIP (N) is  $105^\circ\text{C/Watt}$ , the molded plastic SO (M) package is  $155^\circ\text{C/Watt}$ , and the cerdip (J) package is  $125^\circ\text{C/Watt}$ . All numbers apply for packages soldered directly into a printed circuit board.

**Note 4:** Limits are guaranteed by testing or correlation.

**Note 5:** For single supply operation, the following conditions apply:  $V^+ = 5\text{V}$ ,  $V^- = 0\text{V}$ ,  $V_{CM} = 2.5\text{V}$ ,  $V_{OUT} = 2.5\text{V}$ . Pin 1 & Pin 8 ( $V_{OS}$  Adjust) are each connected to Pin 4 ( $V^-$ ) to realize maximum output swing. This connection will degrade  $V_{OS}$ .

**Note 6:**  $C_L \leq 5\text{ pF}$ .

**Note 7:** In order to achieve optimum AC performance, the input stage was designed without protective clamps. Exceeding the maximum differential input voltage results in reverse breakdown of the base-emitter junction of one of the input transistors and probable degradation of the input parameters (especially  $V_{OS}$ ,  $I_{OS}$ , and Noise).

**Note 8:** The average voltage that the weakest pin combinations (those involving Pin 2 or Pin 3) can withstand and still conform to the datasheet limits. The test circuit used consists of the human body model of  $100\text{ pF}$  in series with  $1500\Omega$ .

## AC Electrical Characteristics (Continued)

**Note 9:**  $V_{IN} = 4V$  step. For supply =  $\pm 5V$ ,  $V_{IN} = 1V$  step.

**Note 10:** Voltage Gain is the total output swing (20V) divided by the input signal required to produce that swing.

**Note 11:** The voltage between  $V^+$  and either input pin must not exceed 36V.

**Note 12:** A military RETS electrical test specification is available on request. At the time of printing, the LM6164J/883 RETS spec complied with the **Boldface** limits in this column. The LM6164J/883 may also be procured as Standard Military Drawing #5962-8962401PA.

## Simplified Schematic

## Applications Tips

The LM6364 has been compensated for gains of 5 or greater (over specified ranges of temperature, power supply voltage, and load). Since this compensation involved adding emitter-degeneration resistors in the op amp's input stage, the open-loop gain was reduced as the stability increased. Gain error due to reduced  $A_{VOL}$  is most apparent at high gains; thus, the uncompensated LM6365 is appropriate for gains of 25 or more. If unity-gain operation is desired, the LM6361 should be used. The LM6361, LM6364, and LM6365 have the same high slew rate (typically 300 V/ $\mu$ s), regardless of their compensation.

The LM6364 is unusually tolerant of capacitive loads. Most op amps tend to oscillate when their load capacitance is greater than about 200 pF (in low-gain circuits). However, load capacitance on the LM6364 effectively increases its compensation capacitance, thus slowing the op amp's response and reducing its bandwidth. The compensation is not ideal, though, and ringing or oscillation may occur in low-gain circuits with large capacitive loads. To overcompensate the LM6364 for operation at gains less than 5, a series resistor-capacitor network should be added between the input pins (as shown in the Typical Applications, Noise Gain Compensation) so that the high-frequency noise gain rises to at least 5.

Power supply bypassing will improve the stability and transient response of the LM6364, and is recommended for every design. 0.01  $\mu$ F to 0.1  $\mu$ F ceramic capacitors should be used (from each supply "rail" to ground); if the device is far away from its power supply source, an additional 2.2  $\mu$ F to 10  $\mu$ F (tantalum) may be required for extra noise reduction.

Keep all leads short to reduce stray capacitance and lead inductance, and make sure ground paths are low-impedance, especially where heavier currents will be flowing. Stray capacitance in the circuit layout can cause signal coupling between adjacent nodes, so that circuit gain unintentionally varies with frequency.

Breadboarded circuits will work best if they are built using generic PC boards with a good ground plane. If the op amps are used with sockets, as opposed to being soldered into the circuit, the additional input capacitance may degrade circuit performance.

## Typical Applications

Offset Voltage Adjustment

Video-Bandwidth Amplifier

Noise-Gain Compensation for Gains  $\leq 5$

$$R_X C_X \geq (2\pi \cdot 25 \text{ MHz})^{-1}$$

$$5 R_X = R_1 + R_F (1 + R_1/R_2)$$
