# 16-Channel/Dual 8-Channel High Performance CMOS Analog Multiplexers

## General Description

The DG406/DG407 are monolithic CMOS analog multiplexers (muxes). The DG406 is a single-ended 1-of-16 device, and the DG407 is a differential 2-of-8 device. Both are pin and functionally compatible with the industry-standard DG506A/DG507A.

The DG406/DG407 are fabricated with Maxim's new improved silicon gate process. Both parts offer low on resistance ( $100\Omega$  max), improved leakage over temperature, low power consumption ( $I_{SUPPLY} = 75\mu A$  max) and fast switching speeds ( $t_{TRANS} = 250ns$  max). The 44V maximum breakdown voltage allows switch-off blocking capability rail-to-rail.

These muxes can be used with a single positive supply (+12V to +30V) or split supplies ( $\pm 4.5V$  to  $\pm 20V$ ) while retaining CMOS logic input compatibility. CMOS inputs provide reduced input loading.

**Note 1:** Signals on Sx, Dx, or INx exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.

**Note 2:** All leads are soldered or welded to PC board.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
