# LM101A/LH2101A

## General Purpose Operational Amplifier

### Features

- Input offset voltage 0.7 mV
- Input bias current 30 nA
- Input offset current 1.5 nA
- Full frequency compensation 30pF
- Supply voltage  $\pm 5.0\text{V}$  to  $\pm 20\text{V}$

### Description

The LM101A/LH2101A is a general purpose high performance operational amplifier fabricated monolithically on a silicon chip by an advanced epitaxial process. The LH2101A consists of two LM101A ICs in one 16-lead DIP. The units may be fully compensated with the addition of a 30 pF capacitor stabilizing the circuit for all feedback configurations including capacitive loads.

The device may be operated as a comparator with a differential input as high as 30V. Used as a comparator the output can be clamped at any desired level to make it compatible with logic circuits.

The LM101A and LH2101A operate over the full military temperature range from  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

## Pin Assignments

## Absolute Maximum Ratings

Parameter	Min.	Max.	Units
Supply Voltage		$\pm 22$	V
Differential Input Voltage		30	V
Input Voltage <sup>1</sup>		$\pm 15$	V
Output Short-Circuit Duration <sup>2</sup>	Indefinite		
Storage Temperature Range	-65	+150	°C
Operating Temperature Range	-55	+125	°C
Lead Soldering Temperature (60 sec)		+300	°C

### Notes:

- For supply voltages less than  $\pm 15\text{V}$ , the absolute maximum input voltage is equal to the supply voltage.
- Observe package thermal characteristics.

## Thermal Characteristics

Parameter	8-Lead Ceramic DIP	8-Lead TO-99 Metal Can	16-Lead Ceramic DIP
Maximum Junction Temperature	+175°C	+175°C	+175°C
Maximum $P_D$ $T_A < 50^\circ\text{C}$	833 mW	658 mW	1042 mW
Thermal Resistance, $\theta_{JC}$	45°C/W	50°C/W	60°C/W
Thermal Resistance, $\theta_{JA}$	150°C/W	190°C/W	120°C/W
For $T_A > 50^\circ\text{C}$ Derate at	8.33 mW/°C	5.26 mW/°C	8.33 mW/°C

## Electrical Characteristics

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

# LM108A/LH2108A

## Precision Operational Amplifiers

### Features

- Low input bias current — 2 nA
- Low input offset current — 200 pA
- Low input offset voltage — 500 $\mu$ V
- Low input offset drift — 5  $\mu$ V/°C
- Wide supply range —  $\pm$ 3V to  $\pm$ 20V
- Low supply current — 0.6 mA
- High PSRR — 96 dB
- High CMRR — 96 dB
- MIL-STD-883B available

### Description

The LM108A operational amplifiers features low input bias current combined with the advantages of bipolar transistor construction; input offset voltages and currents are kept low over a wide range of temperature and supply voltage. Fairchild Semiconductor's superbeta bipolar manufacturing process includes extra treatment at epitaxial growth to ensure low input voltage noise.

The LH2108 consists of two LM108 ICs in one 16-lead DIP. The "A" versions meet tighter electrical specifications than the plain versions. All types are available with 883B military screening.

## Pin Assignments

## Absolute Maximum Ratings

Parameter	Min.	Max.	Units
Supply Voltage		$\pm 20$	V
Differential Input Current <sup>1</sup>		$\pm 10$	mA
Input Voltage <sup>2</sup>		$\pm 15$	V
Output Short-Circuit Duration <sup>2</sup>	Continuous		
Operating Temperature Range	-55	+125	°C
Storage Temperature Range	-65	+150	°C
Lead Soldering Temperature (60 seconds)		+300	°C

### Notes:

- The inputs are shunted with back-to-back diodes for overvoltage protection. Therefore, if a differential input voltage in excess of 1V is applied between the inputs, excessive current will flow, unless some limiting resistance is provided.
- For supply voltages less than  $\pm 15$ V, the absolute maximum input voltage is equal to the supply voltage.

Supply Current	Each Amplifier			0.6			0.6	mA

### Notes:

1. Guaranteed by input bias current specification.
2. Sample tested.

## Typical Applications

The LM108 series has very low input offset and bias currents; the user is cautioned that printed circuit board leakages can produce significant errors especially at high board temperatures. Careful attention to board layout and

cleaning procedure is required to achieve the LM108A's rated performance. It is suggested that board leakage be minimized by encircling the input pins with a guard ring maintained at a potential close to that of the inputs. The guard ring should be driven by a low impedance source such as an amplifier's output or ground.

# LM111/LH2111

## Voltage Comparators

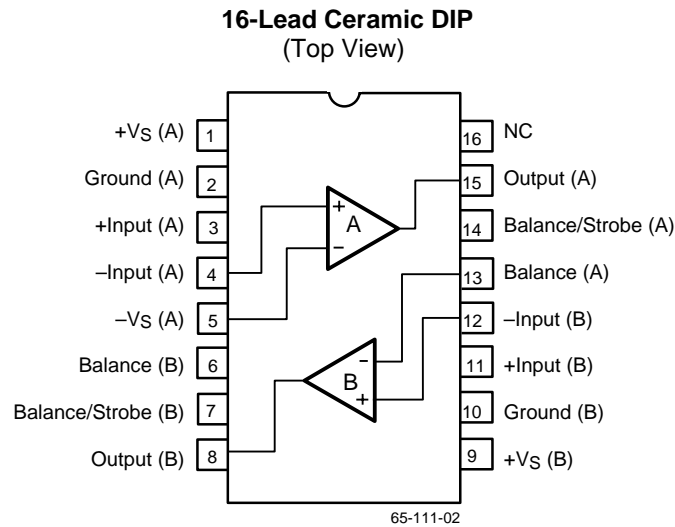

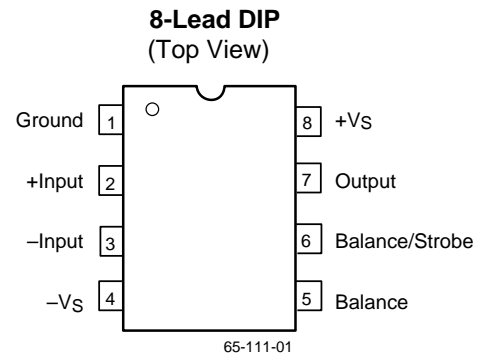

### Features

- Low input offset current — 4 nA
- Low input bias current — 60 nA
- Operates from a single +5V supply
- Response Time — 200 ns

### Description

These low input current voltage comparators are designed to operate over a wide range of supply voltages, including +15V and single +5V supplies. Their outputs are compatible with DTL, RTL, TTL and MOS devices, and can be connected in “wire-OR” configuration. The LH2111 consists of two LM111 ICs packaged in a 16-lead DIP. The LH2111 is available with MIL-STD 883B screening.

## Pin Assignments

For T <sub>A</sub> > 50°C Derate at	5.26 mW/°C	8.33 mW/°C	8.38 mW/°C

## Electrical Characteristics

V<sub>S</sub> = ±15V<sup>1</sup> and -55°C ≤ T<sub>A</sub> ≤ +125°C unless otherwise noted.

Parameters	Test Conditions	Min.	Typ.	Max.	Units
Input Offset Voltage <sup>2</sup>	T <sub>A</sub> = +25°C, R <sub>S</sub> 50 kΩ		0.7	3.0	mV
Input Offset Current <sup>2</sup>	T <sub>A</sub> = +25°C		4.0	10	nA
Input Bias Current	T <sub>A</sub> = +25°C		60	100	nA
Large Signal Voltage Gain	T <sub>A</sub> = +25°C	40	200		V/mV
Response Time	T <sub>A</sub> = +25°C, 100 mV step, 5 mV overdrive		200		ns
Output Voltage Low (VOL)	V <sub>IN</sub> ≤ 5 mV, I <sub>L</sub> = 50 mA, T <sub>A</sub> = +25°C		3.0		mA
Output Leakage current	V <sub>IN</sub> 25 mV, V <sub>OUT</sub> = 35V, T <sub>A</sub> = +25°C, I <sub>STROBE</sub> = 3 mA		0.2	10	nA
Input Offset Voltage <sup>2</sup>	R <sub>S</sub> ≤ 50 KΩ		1.5	4.0	mV
Input Offset Current <sup>2</sup>			5.0	20	nA
Input Bias Current			100	150	nA
Input Voltage Range	Pin 7 pull up may go to +5V	-14.5		13.0	V
Output Voltage Low (VOL)	+V <sub>S</sub> = 4.5V, -V <sub>S</sub> = 0V, V <sub>IN</sub> ≤ -6 mV, I <sub>OUT</sub> = 8.0 mA		0.23	0.4	V
Output Leakage Current	V <sub>IN</sub> ≥ 5 mV, V <sub>OUT</sub> = 35V		100	500	nA
Positive Supply Current	T <sub>A</sub> = +25°C, each amplifier		5.1	6.0	mA
Negative Supply Current	T <sub>A</sub> = +25°C, each amplifier		4.1	5.0	mA

### Notes:

1. V<sub>OS</sub>, I<sub>OS</sub> and I<sub>B</sub> specifications apply for V<sub>S</sub> = +5V to V<sub>S</sub> = ±15V.
2. V<sub>OS</sub> and I<sub>OS</sub> are maximum values required to drive the output to within 1V of either supply with a 1 mA load.
3. Do not short circuit the strobe pin to ground—drive it with a 3 to 5 mA current. Instead.
4. If the strobe and balance pins are unused, short them together for maximum AC stability.

# LM124/LM324

## Single-Supply Quad Operational Amplifier

### Features

- Large DC voltage gain—100 dB
- Compatible with all forms of logic
- Temperature compensated
- Unity Gain Bandwidth—1 MHz
- Large output voltage swing—0V to (+VS -1.5V)
- Input common mode voltage range includes ground

### Description

Each of the devices in this series consists of four independent high-gain operational amplifiers that are designed for single-supply operation. Operation from split power supplies is also possible and the low power supply drain is independent of the magnitude of the power supply voltage.

Used with a dual supply, the circuit will operate over a wide range of supply voltages. However, a large amount of crossover distortion may occur with loads to ground. An external current-sinking resistor to -VS will reduce crossover distortion. There is no crossover distortion problem in single-supply operation if the load is direct-coupled to ground.

## Pin Assignments

## Absolute Maximum Ratings

Parameter	Conditions	Min.	Max.	Units
Supply Voltage			+32 or $\pm 16$	V
Differential Input Voltage			32	V
Input Voltage		-0.3	+32	V
Output Short Circuit to Ground <sup>1</sup>	One Amplifier $+V_S \leq 15V$ and $T_A = +25^\circ C$	Continuous		
Input Current <sup>2</sup>	$V_{IN} < -0.3V$		50	mA
<b>Operating Temperature Range</b>				
LM124		-55	+125	$^\circ C$
LM324		0	+70	$^\circ C$

### Notes:

- Short circuits from the output to  $+V_S$  can cause excessive heating and eventual destruction. The maximum output current is approximately 40 mA independent of the magnitude of  $+V_S$ . At values of supply voltage in excess of  $+V_S$ , continuous short circuits can exceed the power dissipation ratings and cause eventual destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.
- This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltages of the op amps to go to the  $+V_S$  voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and normal output states will re-establish when the input voltage again returns to a value greater than 0.3V.

## Thermal Characteristics

Parameter	SOIC	Plastic DIP	Ceramic DIP
Maximum Junction Temperature	+125 $^\circ C$	+125 $^\circ C$	+175 $^\circ C$
Max. PD $T_A < 50^\circ C$	300 mW	468 mW	1042 mW
Thermal Resistance, $\theta_{JC}$	—	—	60 $^\circ C/W$
Thermal Resistance, $\theta_{JA}$	200 $^\circ C/W$	160 $^\circ C/W$	120 $^\circ C/W$
For $T_A > 50^\circ C$ Derate at	5.0 mW/ $^\circ C$	6.25 mW/ $^\circ C$	8.38 mW/ $^\circ C$

## Electrical Characteristics

+V<sub>S</sub> = +5.0V (see Note 1) and T<sub>A</sub> = +25°C, unless otherwise noted.

Parameters		Test Conditions	LM124			LM324			Units
			Min.	Typ.	Max.	Min.	Typ.	Max.	
Input Offset Voltage <sup>1</sup>				±2.0	±5.0		±2.0	±7.0	mV
Input Bias Current <sup>2</sup>				45	150		45	250	nA
Input Offset Current				±3.0	±30		±5.0	±50	nA
Input Voltage Range <sup>3</sup>		+V <sub>S</sub> = +30V	0		+V <sub>S</sub> -1.5	0		+V <sub>S</sub> -1.5	V
Supply Current (Over Temperature)		R <sub>L</sub> = ∞, +V <sub>S</sub> = 30V		1.5	3.0		1.5	3.0	mA
		R <sub>L</sub> = ∞ on all op amps		0.7	1.2		0.7	1.2	mA
Large Signal Voltage Gain		+V <sub>S</sub> = 15V (for large V <sub>OUT</sub> swing) R <sub>L</sub> ≥ 2 KΩ	50	100		25	100		V/mV
Output Voltage Swing	V <sub>OH</sub>	+V <sub>S</sub> = +30V, R <sub>L</sub> = 2KΩ	26			26			V
	V <sub>OH</sub>	R <sub>L</sub> ≥ 10 KΩ	27	28		27	28		V
	V <sub>OL</sub>	+V <sub>S</sub> = +5.0V, R <sub>L</sub> = 10KΩ		5.0	20		5.0	20	mV
Common Mode Rejection Ratio			70	85		65	70		dB
Power Supply Rejection Ratio			65	100		65	100		dB
Channel Separation <sup>4</sup>		F = 1 KHz to 20 KHz (Input referred)		-120			-120		dB
Output Current	Source	V <sub>IN+</sub> = 1V, V <sub>IN-</sub> = 0V, +V <sub>S</sub> = 15V	20	40		20	40		mA
	Sink	V <sub>IN-</sub> = 1V, V <sub>IN+</sub> = 0V, +V <sub>S</sub> = 15V	10	20		10	20		mA
		V <sub>IN+</sub> = 1V, V <sub>IN-</sub> = 0V, +V <sub>OUT</sub> = 200 mV	12	50		12	50		μA

### Notes:

1. V<sub>OUT</sub> = 1.4V, R<sub>S</sub> = 0Ω with +V<sub>S</sub> from 5V to 30V; and over the full common mode range (0V to +V<sub>S</sub>-1.5V).
2. The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the input lines.
3. The input common mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common mode voltage range is +V<sub>S</sub>-1.5V, but either or both inputs can go to +32V without damage.
4. Due to proximity of external components, ensure that coupling is not originating via stray capacitance between these external parts. This typically can be detected as this type of capacitance increases at higher frequencies.

## Electrical Characteristics

+V<sub>S</sub> = +5.0V, LM124 = -55° ≤ T<sub>A</sub> ≤ 125°C, LM324 = 0°C ≤ T<sub>A</sub> ≤ 70°C unless other wise noted.

Parameters		Test Conditions	LM124			LM324			Unit

# LM139/LM139A, LM339

## Single Supply Quad Comparators

### Features

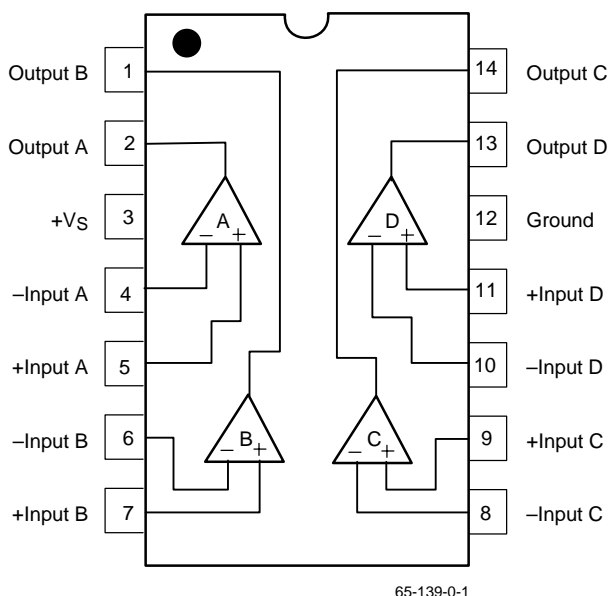

- Input common mode voltage range includes ground
- Wide single supply voltage range—2V to 36V
- Output compatible with TTL, DTL, ECL, MOS and CMOS logic systems
- Very low supply current drain (0.8 mA) independent of supply voltage

### Description

These devices offer higher frequency operation and faster switching than can be had from internally compensated quad op amps. Intended for single supply applications, the Darlington PNP input stage allows them to compare voltages that include ground. The two stage common-emitter output circuit provides gain and output sink capacity of 3.2 mA at an output level of 400 mV. The output collector is left open, permitting the designer to drive devices in the range of 2V to 36V.

They are intended for applications not needing response time less than 1  $\mu$ s, but demanding excellent op amp input parameters to offset voltage, current and bias current, to ensure accurate comparison with a reference voltage.

## Pin Assignments

## Absolute Maximum Ratings

Parameter	Min.	Max.	Unit.
Supply Voltage	-8	+36 or +8	V
Differential Input Voltage		36	V
Input Voltage Range <sup>2</sup>	-0.3	+36	V
Output Short Circuit to Ground <sup>1</sup>	Continuous		
Input Current ( $V_{IN} < -0.3V$ ) <sup>(2)</sup>		50	mA
Operating Temperature Range			
LM139	-55	+125	°C
LM339	0	+70	°C
Storage Temperature Range	-65	150	°C
Lead Soldering Temperature			
SOIC, 10 seconds		+260	°C
DIP, 60 seconds		+300	°C

### Notes:

- Short circuits from the output to +V<sub>S</sub> can cause excessive heating and eventual destruction. The maximum output current is approximately 20 mA independent of the magnitude of +V<sub>S</sub>.
- This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltage of the comparators to go to the +V<sub>S</sub> voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and nominal output states will re-establish when the input voltage, which was negative, again returns to a value greater than -0.3V.

## Thermal Characteristics

Parameter	SOIC	Plastic DIP	Ceramic DIP
Maximum Junction Temperature	+125°C	+125°C	+175°C
Maximum P <sub>D</sub> T <sub>A</sub> < 50°C	300 mW	468 mW	1042mW
Thermal Resistance, $\theta_{JC}$	—	—	60°C/W
Thermal Resistance, $\theta_{JA}$	200°C/W	160°C/W	120°C/W
For T <sub>A</sub> > 50°C Derate at	5.0 mW/°C	6.25 mW/°C	8.33 mW/°C

## Electrical Characteristics

V<sub>S</sub> = +5V, see Note 1.

Parameters	Test Conditions	LM139A			Unit
		Min.	Typ.	Max.	
Input Offset Voltage	T <sub>A</sub> = +25°C <sup>2</sup>		±1.0	±2.0	mV

Input Offset Current	T <sub>A</sub> = +25°C, V <sub>CM</sub> = 0V		±3.0	±25	nA
Input Voltage Range	T <sub>A</sub> = +25°C <sup>4</sup> , V <sub>S</sub> = 30V			+V <sub>S</sub> –1.5	V
Supply Current	R <sub>L</sub> = ∞ on all comparators, T <sub>A</sub> = +25°C		0.8	2.5	mA
Large Signal Voltage Gain	R <sub>L</sub> = ∞, +V <sub>S</sub> = 30V, R <sub>L</sub> ≥ 15 KΩ, +V <sub>S</sub> = +5V (to support large V <sub>OUT</sub> swing) T <sub>A</sub> = +25°C	50	200		V/mV
Large Signal Response Time	V <sub>IN</sub> = TTL Logic Swing, V <sub>REF</sub> = 1.4V, V <sub>RL</sub> = 5V, R <sub>L</sub> = 5.1 KΩ, T <sub>A</sub> = +25°C		300		ns
Response Time	V <sub>RL</sub> = 5V, R <sub>L</sub> = 5.1 KΩ, T <sub>A</sub> = +25°C <sup>5</sup>		1.3		μs
Output Sink Current	V <sub>IN-</sub> ≥ 1V, V <sub>IN+</sub> = 0, V <sub>OUT</sub> ≤ 1.5V, T <sub>A</sub> = +25°C	6.0	16		mA
Saturation Voltage	V <sub>IN-</sub> ≥ 1V, V <sub>IN+</sub> = 0, I <sub>SINK</sub> ≤ 4 mA, T <sub>A</sub> = 25°C		250	400	mV
Output Leakage Current	V <sub>IN+</sub> ≥ 1V, V <sub>IN-</sub> = 0, V <sub>OUT</sub> = 5V, T <sub>A</sub> = +25°C		0.1		μA
Input Offset Voltage <sup>2</sup>				±4.0	mV
Input Offset Current	V <sub>CM</sub> = 0V			±100	nA
Input Bias Current	V <sub>CM</sub> = 0V			300	nA
Input Voltage Range	+V <sub>S</sub> = 30V	0		+V <sub>S</sub> –2.0	V
Saturation Voltage	V <sub>IN-</sub> ≥ 1V, V <sub>IN+</sub> = 0, I <sub>SINK</sub> ≤ 4 mA			700	mV
Output Leakage Current	V <sub>IN+</sub> ≥ 1V, V <sub>IN-</sub> = 0, V <sub>OUT</sub> = 30V			1.0	μA
Differential Input Voltage <sup>7</sup>	V <sub>IN+</sub> ≥ 0V, (or -V <sub>S</sub> , if used) <sup>6</sup>			36	V

### Notes:

- These specifications apply for +V<sub>S</sub> = 5V and -55°C ≤ T<sub>A</sub> ≤ +125°C, unless otherwise stated. The LM339 temperature specifications are limited to 0°C ≤ T<sub>A</sub> ≤ +70°C.
- At output switch points V<sub>OUT</sub> = 1.4V, R<sub>S</sub> = 0Ω with +V<sub>S</sub> from 5V to 30V; and over the full input common mode range (V<sub>OUT</sub> to +V<sub>S</sub>–1.5V).
- The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the reference or input lines.
- The input common mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common mode voltage range is +V<sub>S</sub>–1.5V, but either or both inputs can go to +30V without damage.
- The response time specified is for a 100 mV input step with 5 mV overdrive. For larger overdrive signals 300 ns can be obtained. See Typical Performance Characteristics section.
- Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common mode range, the comparator will provide a proper output state. The low input voltage stage must not be less than -0.3V (or 0.3V below the magnitude of the negative power supply, if used).
- Guaranteed by design.

### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## DUAL OPERATIONAL AMPLIFIERS

The LM1458 series are dual general purpose operational amplifiers, having short circuits protected and require no external components for frequency compensation.

High common mode voltage range and absence of "latch up" make the LM1458 ideal for use as voltage followers.

The high gain and wide range of operating voltage provides superior performance in integrator, summing amplifier and general feedback applications.

## FEATURES

- Internal frequency compensation
- Short circuit protection
- Large common mode and differential voltage range
- No latch up
- Low power consumption

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.

# LM148

## Low Power Quad 741 Operational Amplifier

### Features

- 741 op amp operating characteristics
- Low supply current drain—0.6 mA/amplifier
- Class AB output stage—no crossover distortion
- Pin compatible with the LM124
- Low input offset voltage—1.0 mV
- Low input offset current—4.0 nA
- Low input bias current—30 nA
- Unity gain bandwidth—1.0 MHz
- Channel Separation—120 dB
- Input and output overload protection

### Description

The LM148 is a true quad 741. It consists of four independent high-gain, internally compensated, low-power operational amplifiers which have been designed to provide functional characteristics identical to those of the familiar 741 operational amplifier. In addition, the total supply current for all four amplifiers is comparable to the supply current of a single 741 type op amp. Other features include input offset currents and input bias currents which are much less than those of a standard 741. Also, excellent isolation between amplifiers has been achieved by independently biasing each amplifier and using layout techniques which minimize thermal coupling.

The LM148 can be used anywhere multiple 741 type amplifiers are being used and in applications where amplifier matching or high packing density is required.

## Applications Discussion

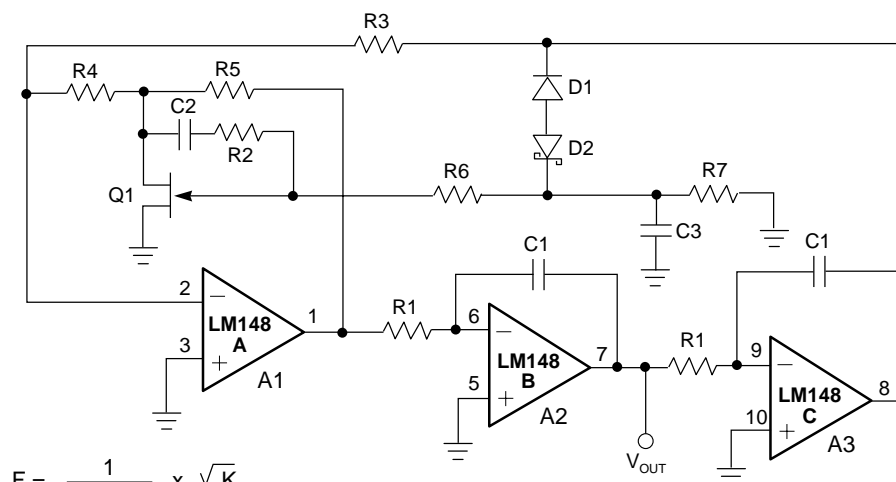

The LM148 low power quad operational amplifier exhibits performance comparable to the popular 741. Substitution can therefore be made with no change in circuit behavior.

The input characteristics of these devices allow differential voltages which exceed the supplies. Output phase will be correct as long as one of the inputs is within the operating common mode range. If both exceed the negative limit, the output will latch positive. Current limiting resistors should be used on the inputs in case voltages become excessive.

When capacitive loading becomes much greater than 100pF, a resistor should be placed between the output and feedback connection in order to reduce phase shift.

The LM148 is short circuit protected to ground and supplies continuously when only one of the four amplifiers is shorted. If multiple shorts occur simultaneously, the unit can be destroyed due to excessive power dissipation.

To assure stability and to minimize pickup, feedback resistors should be placed close to the input to maximize the feedback pole frequency (a function of input to ground capacitance). A good rule of thumb is that the feedback pole frequency should be 6 times the operating -3.0B frequency. If less, a lead capacitor should be placed between the output and input.

$$F = \frac{1}{2\pi R_1 C_1} \times \sqrt{K}$$

$$K = \frac{R_4 R_5}{R_3} \left( \frac{1}{R_{DS}} + \frac{1}{R_4} + \frac{1}{R_5} \right)$$

$$R_{DS} \cong \left( \frac{R_{ON}}{1 - \frac{V_{GS}}{V_P}} \right)^{1/2}$$

$$F_{MAX} = 5.0 \text{ KHz}, \text{ THD} \leq 0.03\%$$

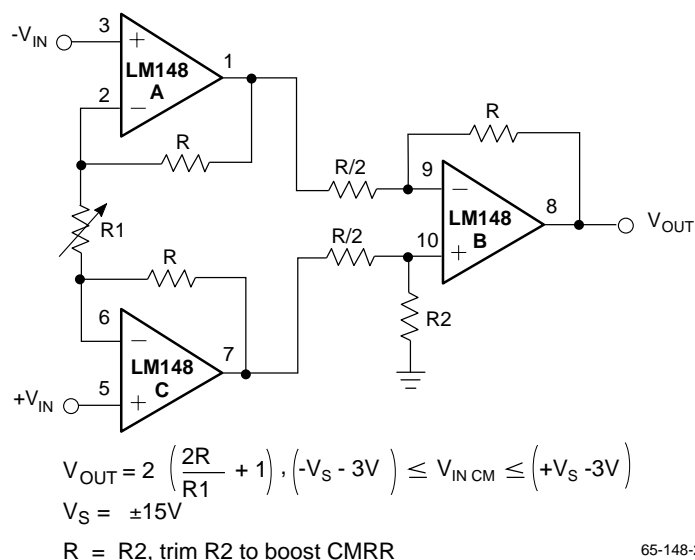

R1 = 100K pot., C1 = 0.0047 μF, C2 = 0.01 μF, C3 = 0.1 μF, R2 = R6 = R7 = 1M, R3 = 5.1K, R4 = 12Ω.  
R5 = 240Ω, Q1 = NS5102, D1 = 1N914, D2 = 3.6V avalanche diode (ex. LM103), V<sub>S</sub> = ±15V

A simpler version with some distortion degradation at high frequencies can be made by using A1 as a simple inverting amplifier, and by putting back to back zeners in feedback loop of A3.

### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

# LM1851

## Ground Fault Interrupter

### Features

- No potentiometer required
- Direct interface to SCR
- Supply voltage derived from AC line—26V shunt
- Adjustable sensitivity
- Grounded neutral fault detection
- Meets UL943 standards
- 450  $\mu$ A quiescent current
- Ideal for 120V or 220V systems

### Description

The LM1851 is a controller for AC outlet ground fault interrupters. These devices detect hazardous grounding conditions (example: a pool of water and electrical equipment connected to opposite phases of the AC line) in consumer and industrial environments. The output of the IC triggers an external SCR, which in turn opens a relay circuit breaker to prevent a harmful or lethal shock.

Full advantage of the U.S. UL943 timing specification is taken to ensure maximum immunity to false triggering due

to line noise. A special feature is found in circuitry that rapidly resets the integrating timing capacitor in the event that noise pulses introduce unwanted charging currents. Also, flip-flop is included that ensures firing of even a slow circuit breaker relay on either half-cycle of the line voltage when external full wave rectification is used.

The application circuit can be configured to detect both normal faults (hot wire to ground) and grounded neutral faults.

### Block Diagram

## Functional Description

The voltage at the supply pin is clamped to +26V by the internal shunt regulator D3. This shunt regulator also generates an artificial ground voltage for the noninverting input of A1 (shown as a +10V source). A1, Q1, and Q2 act as a current mirror for fault current signals (which are derived from an external transformer). When a fault signal is present, the mirrored current charges the external timing capacitor until its voltage exceeds the latch trigger threshold (typically 17.5V). When then this threshold is exceeded, the latch engages and Q3 turns off, allowing I2 to drive the SCR connected to pin 1.

Extra Circuitry in the feedback path of A1 works with the switched current source I1 to remove any charge on C<sub>T</sub> induced by noise in the transformer. If no fault current is

present, then I1 discharges C<sub>T</sub> with a current equal to 3 I<sub>TH</sub>, where I<sub>TH</sub> is the value of current set by the external R<sub>SET</sub> resistor. If fault signals are present at the input of A1 (which is held at virtual ground, +10V), one of the two current mirrors in the feedback path of A1 (Q4 and Q5) will become active, depending on which half-cycle the fault occurs. This action will raise the voltage at V<sub>S</sub>, switching I1 to a value equal to I<sub>TH</sub>, and reducing the discharge rate of C<sub>T</sub> to better allow fault currents to charge it.

Notice that I<sub>TH</sub> discharges C<sub>T</sub> during both half-cycles of the line, while I<sub>F</sub> only charges C<sub>T</sub> during the half-cycle in which I<sub>F</sub> exits pin 2 (since Q1 will only carry fault current in one direction). Thus, during one half-cycle, I<sub>F</sub>-I<sub>TH</sub> charges C<sub>T</sub>, while during the other half-cycle I<sub>TH</sub> discharges it.

## Applications Discussion

A typical ground fault interrupter circuit is shown in Figure 10. It is designed to operate on 120 VAC line voltage with 5 mA normal fault sensitivity.

A full-wave rectifier bridge and a 15k/2W resistor are used to supply the dc power required by the IC. A 1  $\mu$ F capacitor at pin 8 is used to filter the ripple of the supply voltage and is also connected across the SCR to allow firing of the SCR on either half-cycle. When a fault causes the SCR to trigger, the circuit breaker is energized and line voltage is removed from the load.

At this time no fault current flows and the  $C_T$  discharge current increases from  $I_{TH}$  to  $3I_{TH}$  (see Block Diagram). This quickly resets both the timing capacitor and the output latch. The circuit breaker can be reset and the line voltage again supplied to the load, assuming the fault has been removed. A 1000:1 sense transformer is used to detect the normal fault. The fault current, which is basically the difference current between the hot and neutral lines, is stepped down by 1000 and fed into the input pin of the operational amplifier through a 10  $\mu$ F capacitor. The 0.0033  $\mu$ F capacitor between pin 2 and pin 3 and the 200 pF between pins 3 and 4 are added to obtain better noise immunity. The normal fault sensitivity is determined by the timing capacitor discharging current,  $I_{TH}$ .  $I_{TH}$  can be calculated by:

$$I_{TH} = \frac{7V}{R_{SET}} \div 2 \quad (1)$$

At the decision point, the average fault current just equals the threshold current,  $I_{TH}$ .

$$I_{TH} = \frac{I_F(\text{rms})}{2} \times 0.91 \quad (2)$$

Where  $I_F(\text{rms})$  is the rms input fault current to the operational amplifier and the factor of 2 is due to the fact that  $I_F$  charges the timing capacitor only during one half-cycle, while  $I_{TH}$  discharges the capacitor continuously. The factor 0.91 converts the rms value to an average value. Combining equations (1) and (2) we have:

$$R_{SET} = \frac{7V}{I_F(\text{rms}) \times 0.91} \quad (3)$$

For example, to obtain 5 mA(rms) sensitivity for the circuit in Figure 7 we have:

$$R_{SET} = \frac{7V}{\frac{5 \text{ mA} \times 0.91}{1000}} = 1.5 \text{ M}\Omega \quad (4)$$

The correct value for  $R_{SET}$  can also be determined from the characteristic curve that plots equation (3). Note that this is an approximate calculation; the exact value of  $R_{SET}$  depends on the specific sense transformer used and LM1851 tolerances. Inasmuch as UL943 specifies a sensitivity "window" of 4 mA to 6mA, provision should be made to adjust  $R_{SET}$  with a potentiometer.

Independent of setting sensitivity, the desired integration time can be obtained through proper selection of the timing capacitor,  $C_T$ . Due to the large number of variables involved, proper selection of  $C_T$  is best done empirically. The following design example should only be used as a guideline.

Assume the goal is to meet UL943 timing requirements. Also assume that worst case timing occurs during GFI start-up (S1 closure) with both a heavy normal fault and a 2 $\Omega$  grounded neutral fault present. This situation is shown diagrammatically in Figure 8.

Figure 8.

UL943 specifies  $\leq 25$  ms average trip time under these conditions. Calculation of  $C_T$  based upon charging currents due to normal fault only is as follows:

1. Start with a  $\leq 25$  ms specification. Subtract 3 ms GFI turn-on time (15k and 1  $\mu$ F). Subtract 8 ms potential loss of one half-cycle due to fault current sense of half-cycles only.
2. Subtract 4 ms time required to open a sluggish circuit breaker.
3. This gives a total  $\leq 10$  ms maximum integration time that could be allowed.
4. To generate 8 ms value of integration time that accommodates component tolerances and other variables:

$$C_T = \frac{1 \times T}{V} \quad (5)$$

where:

T = integration time

V = threshold voltage

I = average fault current into CT

$$I = \underbrace{\left( \frac{120 V_{AC(rms)}}{R_B} \right)}_{\text{heavy fault current generated (swamps ITH)}} \underbrace{\left( \frac{R_N}{R_G + R_N} \right)}_{\text{portion of fault current shunted around GFI}} \times \underbrace{\left( \frac{1 \text{ turn}}{1000 \text{ turns}} \right)}_{\text{current division of input sense transformer}} \times \underbrace{\left( \frac{1}{2} \right)}_{\text{CT charging on half-cycles only}} \times \underbrace{(0.91)}_{\text{rms to average conversion}} \quad (6)$$

therefore:

$$C_T = \frac{\left[ \left( \frac{120}{500} \right) \times \left( \frac{0.4}{1.6 + 0.4} \right) \times \left( \frac{1}{1000} \right) \times \left( \frac{1}{2} \right) \times (0.91) \right]}{17.5} \times 0.008$$

$$C_T = 0.01 \mu F \quad (7)$$

In practice, the actual value of CT will have to be modified to include the effects of the neutral loop upon the net charging current. The effect of neutral loop induced currents is difficult to quantize, but typically they sum with normal fault currents, thus allowing a larger value of CT.

For UL943 requirements, 0.015  $\mu F$  has been found to be the best compromise between timing and noise.

For those GFI standards not requiring grounded neutral detection, a still larger value capacity can be used and better noise immunity obtained.

The larger capacitor can be accommodated because  $R_N$  and  $R_G$  are not present, allowing the full fault current, I, to enter the GFI.

In Figure 10, grounded neutral detection is accomplished by feeding the neutral coil with 120 Hz energy continuously and allowing some of the energy to couple into the sense transformer during conditions of neutral fault.

Transformers may be obtained from Magnetic Metals, Inc., 21st Street and Hayes Street, Camden, NJ 08101—(609) 964-7842.

### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

# LM1882•54ACT/74ACT715 LM1882-R•54ACT/74ACT715-R Programmable Video Sync Generator

## General Description

The 'ACT715/LM1882 and 'ACT715-R/LM1882-R are 20-pin TTL-input compatible devices capable of generating Horizontal, Vertical and Composite Sync and Blank signals for televisions and monitors. All pulse widths are completely definable by the user. The devices are capable of generating signals for both interlaced and noninterlaced modes of operation. Equalization and serration pulses can be introduced into the Composite Sync signal when needed.

Four additional signals can also be made available when Composite Sync or Blank are used. These signals can be used to generate horizontal or vertical gating pulses, cursor position or vertical Interrupt signal.

These devices make no assumptions concerning the system architecture. Line rate and field/frame rate are all a function of the values programmed into the data registers, the status register, and the input clock frequency.

The 'ACT715/LM1882 is mask programmed to default to a Clock Disable state. Bit 10 of the Status Register, Register 0, defaults to a logic "0". This facilitates (re)programming before operation.

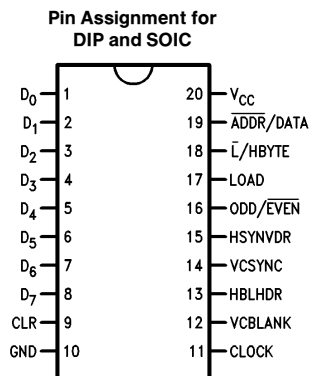

The 'ACT715-R/LM1882-R is the same as the 'ACT715/LM1882 in all respects except that the

'ACT715-R/LM1882-R is mask programmed to default to a Clock Enabled state. Bit 10 of the Status Register defaults to a logic "1". Although completely (re)programmable, the 'ACT715-R/LM1882-R version is better suited for applications using the default 14.31818 MHz RS-170 register values. This feature allows power-up directly into operation, following a single CLEAR pulse.

## Features

- Maximum Input Clock Frequency > 130 MHz
- Interlaced and non-interlaced formats available
- Separate or composite horizontal and vertical Sync and Blank signals available
- Complete control of pulse width via register programming
- All inputs are TTL compatible
- 8 mA drive on all outputs
- Default RS170/NTSC values mask programmed into registers
- 4 KV minimum ESD immunity
- 'ACT715-R/LM1882-R is mask programmed to default to a Clock Enable state for easier start-up into 14.31818 MHz RS170 timing

## Logic Block Diagram

TL/F/10137-3

## Pin Description

There are a Total of 13 inputs and 5 outputs on the 'ACT715/LM1882.

**Data Inputs D0-D7:** The Data Input pins connect to the Address Register and the Data Input Register.

**ADDR/DATA:** The ADDR/DATA signal is latched into the device on the falling edge of the LOAD signal. The signal determines if an address (0) or data (1) is present on the data bus.

**L/HBYTE:** The L/HBYTE signal is latched into the device on the falling edge of the LOAD signal. The signal determines if data will be read into the 8 LSB's (0) or the 4 MSB's (1) of the Data Registers. A 1 on this pin when an ADDR/DATA is a 0 enables Auto-Load Mode.

**LOAD:** The LOAD control pin loads data into the Address or Data Registers on the rising edge. ADDR/DATA and L/HBYTE data is loaded into the device on the falling edge of the LOAD. The LOAD pin has been implemented as a Schmitt trigger input for better noise immunity.

**CLOCK:** System CLOCK input from which all timing is derived. The clock pin has been implemented as a Schmitt trigger for better noise immunity. The CLOCK and the LOAD signal are asynchronous and independent. Output state changes occur on the falling edge of CLOCK.

**CLR:** The CLEAR pin is an asynchronous input that initializes the device when it is HIGH. Initialization consists of setting all registers to their mask programmed values, and initializing all counters, comparators and registers. The CLEAR pin has been implemented as a Schmitt trigger for better noise immunity. A CLEAR pulse should be asserted by the user immediately after power-up to ensure proper initialization of the registers—even if the user plans to (re)program the device.

**Note:** A CLEAR pulse will disable the CLOCK on the 'ACT715/LM1882 and will enable the CLOCK on the 'ACT715-R/LM1882-R.

**ODD/EVEN:** Output that identifies if display is in odd (HIGH) or even (LOW) field of interlace when device is in interlaced mode of operation. In noninterlaced mode of operation this output is always HIGH. Data can be serially scanned out on this pin during Scan Mode.

**VCSYNC:** Outputs Vertical or Composite Sync signal based on value of the Status Register. Equalization and Serration pulses will (if enabled) be output on the VCSYNC signal in composite mode only.

**VCBLANK:** Outputs Vertical or Composite Blanking signal based on value of the Status Register.

**HBLHDR:** Outputs Horizontal Blanking signal, Horizontal Gating signal or Cursor Position based on value of the Status Register.

**HSYNVDR:** Outputs Horizontal Sync signal, Vertical Gating signal or Vertical Interrupt signal based on value of Status Register.

## Register Description

All of the data registers are 12 bits wide. Width's of all pulses are defined by specifying the start count and end count of all pulses. Horizontal pulses are specified with-respect-to the number of clock pulses per line and vertical pulses are specified with-respect-to the number of lines per frame.

### REG0—STATUS REGISTER

The Status Register controls the mode of operation, the signals that are output and the polarity of these outputs. The default value for the Status Register is 0 (000 Hex) for the 'ACT715/LM1882 and is "512" (200 Hex) for the 'ACT715-R/LM1882-R.

## Register Description (Continued)

Bits 0–2

B <sub>2</sub>	B <sub>1</sub>	B <sub>0</sub>	VCBLANK	VCSYNC	HBLHDR	HSYNVDR
0	0	0	CBLANK	CSYNC	HGATE	VGATE
(DEFAULT)						
0	0	1	VBLANK	CSYNC	HBLANK	VGATE
0	1	0	CBLANK	VSYN	HGATE	HSYN
0	1	1	VBLANK	VSYN	HBLANK	HSYN
1	0	0	CBLANK	CSYN	CURSOR	VINT
1	0	1	VBLANK	CSYN	HBLANK	VINT
1	1	0	CBLANK	VSYN	CURSOR	HSYN
1	1	1	VBLANK	VSYN	HBLANK	HSYN

Bits 3–4

B <sub>4</sub>	B <sub>3</sub>	Mode of Operation
0	0	Interlaced Double Serration and Equalization
(DEFAULT)		
0	1	Non Interlaced Double Serration
1	0	Illegal State
1	1	Non Interlaced Single Serration and Equalization

Double Equalization and Serration mode will output equalization and serration pulses at twice the HSYNC frequency (i.e., 2 equalization or serration pulses for every HSYNC pulse). Single Equalization and Serration mode will output an equalization or serration pulse for every HSYNC pulse. In Interlaced mode equalization and serration pulses will be output during the VBLANK period of every odd and even field. Interlaced Single Equalization and Serration mode is not possible with this part.

### Bits 5–8

Bits 5 through 8 control the polarity of the outputs. A value of zero in these bit locations indicates an output pulse active LOW. A value of 1 indicates an active HIGH pulse.

B5— VCBLANK Polarity

B6— VCSYN Polarity

B7— HBLHDR Polarity

B8— HSYNVDR Polarity

### Bits 9–11

Bits 9 through 11 enable several different features of the device.

B9— Enable Equalization/Serration Pulses (0)  
Disable Equalization/Serration Pulses (1)

B10— Disable System Clock (0)  
Enable System Clock (1)

Default values for B10 are “0” in the ‘ACT715/LM1882 and “1” in the ‘ACT715-R/LM1882-R.

B11— Disable Counter Test Mode (0)  
Enable Counter Test Mode (1)

This bit is not intended for the user but is for internal testing only.

## HORIZONTAL INTERVAL REGISTERS

The Horizontal Interval Registers determine the number of clock cycles per line and the characteristics of the Horizontal Sync and Blank pulses.

REG1— Horizontal Front Porch

REG2— Horizontal Sync Pulse End Time

REG3— Horizontal Blanking Width

REG4— Horizontal Interval Width # of Clocks per Line

## VERTICAL INTERVAL REGISTERS

The Vertical Interval Registers determine the number of lines per frame, and the characteristics of the Vertical Blank and Sync Pulses.

REG5— Vertical Front Porch

REG6— Vertical Sync Pulse End Time

REG7— Vertical Blanking Width

REG8— Vertical Interval Width # of Lines per Frame

## EQUALIZATION AND SERRATION PULSE SPECIFICATION REGISTERS

These registers determine the width of equalization and serration pulses and the vertical interval over which they occur.

REG 9— Equalization Pulse Width End Time

REG10— Serration Pulse Width End Time

REG11— Equalization/Serration Pulse Vertical Interval Start Time

REG12— Equalization/Serration Pulse Vertical Interval End Time

## VERTICAL INTERRUPT SPECIFICATION REGISTERS

These Registers determine the width of the Vertical Interrupt signal if used.

REG13— Vertical Interrupt Activate Time

REG14— Vertical Interrupt Deactivate Time

## CURSOR LOCATION REGISTERS

These 4 registers determine the cursor position location, or they generate separate Horizontal and Vertical Gating signals.

REG15— Horizontal Cursor Position Start Time

REG16— Horizontal Cursor Position End Time

REG17— Vertical Cursor Position Start Time

REG18— Vertical Cursor Position End Time

## Signal Specification

### HORIZONTAL SYNC AND BLANK SPECIFICATIONS

All horizontal signals are defined by a start and end time. The start and end times are specified in number of clock cycles per line. The start of the horizontal line is considered pulse 1 not 0. All values of the horizontal timing registers are referenced to the falling edge of the Horizontal Blank signal (see *Figure 1*). Since the first CLOCK edge, CLOCK #1, causes the first falling edge of the Horizontal Blank reference pulse, edges referenced to this first Horizontal edge are  $n + 1$  CLOCKS away, where “n” is the width of the timing in question. Registers 1, 2, and 3 are programmed in this manner. The horizontal counters start at 1 and count until HMAX. The value of HMAX must be divisible by 2. This

## Signal Specification (Continued)

FIGURE 1. Horizontal Waveform Specification

TL/F/10137-4

limitation is imposed because during interface operation this value is internally divided by 2 in order to generate serration and equalization pulses at  $2 \times$  the horizontal frequency. Horizontal signals will change on the falling edge of the CLOCK signal. Signal specifications are shown below.

Horizontal Period (HPER) =  $\text{REG}(4) \times \text{ckper}$   
 Horizontal Blanking Width =  $[\text{REG}(3) - 1] \times \text{ckper}$   
 Horizontal Sync Width =  $[\text{REG}(2) - \text{REG}(1)] \times \text{ckper}$   
 Horizontal Front Porch =  $[\text{REG}(1) - 1] \times \text{ckper}$

### VERTICAL SYNC AND BLANK SPECIFICATION

All vertical signals are defined in terms of number of lines per frame. This is true in both interlaced and noninterlaced modes of operation. Care must be taken to not specify the Vertical Registers in terms of lines per field. Since the first CLOCK edge, CLOCK #1, causes the first falling edge of the Vertical Blank (first Horizontal Blank) reference pulse, edges referenced to this first edge are  $n + 1$  lines away, where "n" is the width of the timing in question. Registers 5, 6, and 7 are programmed in this manner. Also, in the interlaced mode, vertical timing is based on half-lines. Therefore registers 5, 6, and 7 must contain a value twice the total horizontal (odd and even) plus 1 (as described above). In non-interlaced mode, all vertical timing is based on whole-lines. Register 8 is always based on whole-lines and does not add 1 for the first clock. The vertical counter starts at the value of 1 and counts until the value of VMAX. No restrictions exist on the values placed in the vertical registers. Vertical Blank will change on the leading edge of HBLANK. Vertical Sync will change on the leading edge of HSYNC. (See Figure 2A.)

Vertical Frame Period (VPER) =  $\text{REG}(8) \times \text{hper}$   
 Vertical Field Period (VPER/n) =  $\text{REG}(8) \times \text{hper}/n$   
 Vertical Blanking Width =  $[\text{REG}(7) - 1] \times \text{hper}/n$   
 Vertical Syncing Width =  $[\text{REG}(6) - \text{REG}(5)] \times \text{hper}/n$   
 Vertical Front Porch =  $[\text{REG}(5) - 1] \times \text{hper}/n$   
 where  $n = 1$  for noninterlaced  
 $n = 2$  for interlaced

### COMPOSITE SYNC AND BLANK SPECIFICATION

Composite Sync and Blank signals are created by logically ANDing (ORing) the active LOW (HIGH) signals of the corresponding vertical and horizontal components of these signals. The Composite Sync signal may also include serration and/or equalization pulses. The Serration pulse interval occurs in place of the Vertical Sync interval. Equalization pulses occur preceding and/or following the Serration pulses. The width and location of these pulses can be programmed through the registers shown below. (See Figure 2B.)

Horizontal Equalization PW =  $[\text{REG}(9) - \text{REG}(1)] \times \text{ckper}$   
 $\text{REG } 9 = (\text{HFP}) + (\text{HEQP}) + 1$

Horizontal Serration PW =  $[\text{REG}(4)/n + \text{REG}(1) - \text{REG}(10)] \times \text{ckper}$   
 $\text{REG } 10 = (\text{HFP}) + (\text{HPER}/2) - (\text{HSERR}) + 1$

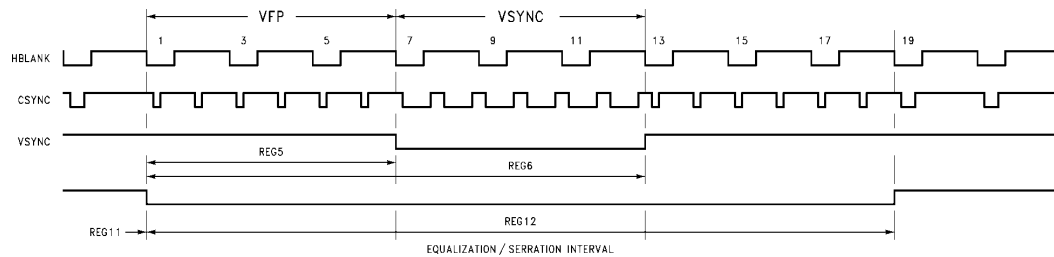

Where  $n = 1$  for noninterlaced single serration/equalization  
 $n = 2$  for noninterlaced double serration/equalization  
 $n = 2$  for interlaced operation

## Signal Specification (Continued)

TL/F/10137-5

FIGURE 2A. Vertical Waveform Specification

TL/F/10137-12

FIGURE 2B. Equalization/Serration Interval Programming

### HORIZONTAL AND VERTICAL GATING SIGNALS

Horizontal Drive and Vertical Drive outputs can be utilized as general purpose Gating Signals. Horizontal and Vertical Gating Signals are available for use when Composite Sync and Blank signals are selected and the value of Bit 2 of the Status Register is 0. The Vertical Gating signal will change in the same manner as that specified for the Vertical Blank.

$$\text{Horizontal Gating Signal Width} = [\text{REG}(16) - \text{REG}(15)] \times \text{ckper}$$

$$\text{Vertical Gating Signal Width} = [\text{REG}(18) - \text{REG}(17)] \times \text{hper}$$

### CURSOR POSITION AND VERTICAL INTERRUPT

The Cursor Position and Vertical Interrupt signal are available when Composite Sync and Blank signals are selected

and Bit 2 of the Status Register is set to the value of 1. The Cursor Position generates a single pulse of n clocks wide during every line that the cursor is specified. The signals are generated by logically ORing (ANDing) the active LOW (HIGH) signals specified by the registers used for generating Horizontal and Vertical Gating signals. The Vertical Interrupt signal generates a pulse during the vertical interval specified. The Vertical Interrupt signal will change in the same manner as that specified for the Vertical Blanking signal.

$$\text{Horizontal Cursor Width} = [\text{REG}(16) - \text{REG}(15)] \times \text{ckper}$$

$$\text{Vertical Cursor Width} = [\text{REG}(18) - \text{REG}(17)] \times \text{hper}$$

$$\text{Vertical Interrupt Width} = [\text{REG}(14) - \text{REG}(13)] \times \text{hper}$$

## Addressing Logic

The register addressing logic is composed of two blocks of logic. The first is the address register and counter (ADDRCNTR), and the second is the address decode (ADDRDEC).

### ADDRCNTR LOGIC

Addresses for the data registers can be generated by one of two methods. Manual addressing requires that each byte of each register that needs to be loaded needs to be addressed. To load both bytes of all 19 registers would require a total of 57 load cycles (19 address and 38 data cycles). Auto Addressing requires that only the initial register value be specified. The Auto Load sequence would require only 39 load cycles to completely program all registers (1 address and 38 data cycles). In the auto load sequence the low order byte of the data register will be written first followed by the high order byte on the next load cycle. At the

time the High Byte is written the address counter is incremented by 1. The counter has been implemented to loop on the initial value loaded into the address register. For example: If a value of 0 was written into the address register then the counter would count from 0 to 18 before resetting back to 0. If a value of 15 was written into the address register then the counter would count from 15 to 18 before looping back to 15. If a value greater than or equal to 18 is placed into the address register the counter will continuously loop on this value. Auto addressing is initiated on the falling edge of LOAD when ADDRDATA is 0 and LHBYTE is 1. Incrementing and loading of data registers will not commence until the falling edge of LOAD after ADDRDATA goes to 1. The next rising edge of LOAD will load the first byte of data. Auto Incrementing is disabled on the falling edge of LOAD after ADDRDATA and LHBYTE goes low.

#### Manual Addressing Mode

Cycle #	Load Falling Edge	Load Rising Edge
1	Enable Manual Addressing	Load Address m
2	Enable Lbyte Data Load	Load Lbyte m
3	Enable Hbyte Data Load	Load Hbyte m
4	Enable Manual Addressing	Load Address n
5	Enable Lbyte Data Load	Load Lbyte n
6	Enable Hbyte Data Load	Load Hbyte n

TL/F/10137-7

#### Auto Addressing Mode

Cycle #	Load Falling Edge	Load Rising Edge
1	Enable Auto Addressing	Load Start Address n
2	Enable Lbyte Data Load	Load Lbyte (n)
3	Enable Hbyte Data Load	Load Hbyte (n); Inc Counter
4	Enable Lbyte Data Load	Load Lbyte (n + 1)
5	Enable Hbyte Data Load	Load Hbyte (n + 1); Inc Counter
6	Enable Manual Addressing	Load Address

TL/F/10137-8

## Addressing Logic (Continued)

### ADDRDEC LOGIC

The ADDRDEC logic decodes the current address and generates the enable signal for the appropriate register. The enable values for the registers and counters change on the falling edge of LOAD. Two types of ADDRDEC logic is enabled by 2 pair of addresses, Addresses 22 or 54 (Vectored Restart logic) and Addresses 23 or 55 (Vectored Clear logic). Loading these addresses will enable the appropriate logic and put the part into either a Restart (all counter registers are reinitialized with preprogrammed data) or Clear (all registers are cleared to zero) state. Reloading the same ADDRDEC address will not cause any change in the state of the part. The outputs during these states are frozen and the internal CLOCK is disabled. Clocking the part during a Vectored Restart or Vectored Clear state will have no effect on the part. To resume operation in the new state, or disable the Vectored Restart or Vectored Clear state, another non-ADDRDEC address must be loaded. Operation will begin in the new state on the rising edge of the non-ADDRDEC load pulse. It is recommended that an unused address be loaded following an ADDRDEC operation to prevent data registers from accidentally being corrupted. The following Addresses are used by the device.

Address 0	Status Register REG0
Address 1–18	Data Registers REG1–REG18
Address 19–21	Unused
Address 22/54	Restart Vector (Restarts Device)
Address 23/55	Clear Vector (Zeros All Registers)
Address 24–31	Unused
Address 32–50	Register Scan Addresses
Address 51–53	Counter Scan Addresses
Address 56–63	Unused

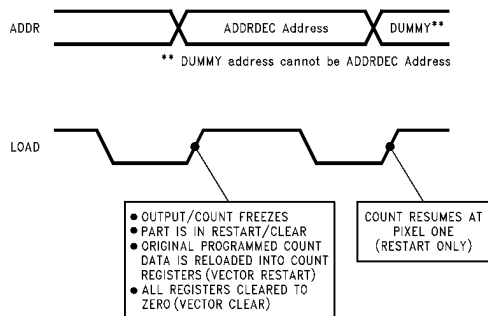

At any given time only one register at most is selected. It is possible to have no registers selected.

### VECTORED RESTART ADDRESS

The function of addresses 22 (16H) or 54 (36H) are similar to that of the CLR pin except that the preprogramming of the registers is not affected. It is recommended but not required that this address is read after the initial device configuration load sequence. A 1 on the ADDRDATA pin (Auto Addressing Mode) will not cause this address to automatically increment. The address will loop back onto itself regardless of the state of ADDRDATA unless the address on the Data inputs has been changed with ADDRDATA at 0.

### VECTORED CLEAR ADDRESS

Addresses 23 (17H) or 55 (37H) is used to clear all registers to zero simultaneously. This function may be desirable to use prior to loading new data into the Data or Status Registers. This address is read into the device in a similar fashion as all of the other registers. A 1 on the ADDRDATA pin (Auto Addressing Mode) will not cause this address to automatically increment. The address will loop back onto itself regardless of the state of ADDRDATA unless the address on the Data inputs has been changed with ADDRDATA at 0.

TL/F/10137-9

FIGURE 3. ADDRDEC Timing

### GEN LOCKING

The 'ACT715/LM1882 and 'ACT715-R/LM1882-R is designed for master SYNC and BLANK signal generation. However, the devices can be synchronized (slaved) to an external timing signal in a limited sense. Using Vectored Restart, the user can reset the counting sequence to a given location, the beginning, at a given time, the rising edge of the LOAD that removes Vector Restart. At this time the next CLOCK pulse will be CLOCK 1 and the count will restart at the beginning of the first odd line.

Preconditioning the part during normal operation, before the desired synchronizing pulse, is necessary. However, since LOAD and CLOCK are asynchronous and independent, this is possible without interruption or data and performance corruption. If the defaulted 14.31818 MHz RS-170 values are being used, preconditioning and restarting can be minimized by using the CLEAR pulse instead of the Vectored Restart operation. The 'ACT715-R/LM1882-R is better suited for this application because it eliminates the need to program a 1 into Bit 10 of the Status Register to enable the CLOCK. Gen Locking to another count location other than the very beginning or separate horizontal/vertical resetting is not possible with the 'ACT715/LM1882 nor the 'ACT715-R/LM1882-R.

### SCAN MODE LOGIC

A scan mode is available in the ACT715/LM1882 that allows the user to non-destructively verify the contents of the registers. Scan mode is invoked through reading a scan address into the address register. The scan address of a given register is defined by the Data register address + 32. The internal Clocking signal is disabled when a scan address is read. Disabling the clock freezes the device in its present state. Data can then be serially scanned out of the data registers through the ODD/EVEN Pin. The LSB will be scanned out first. Since each register is 12 bits wide, completely scanning out data of the addressed register will require 12 CLOCK pulses. More than 12 CLOCK pulses on the same register will only cause the MSB to repeat on the output. Re-scanning the same register will require that register to be reloaded. The value of the two horizontal counters and 1 vertical counter can also be scanned out by using address numbers 51–53. Note that before the part will scan out the data, the LOAD signal must be brought back HIGH.

## Addressing Logic (Continued)

Normal device operation can be resumed by loading in a non-scan address. As the scanning of the registers is a non-destructive scan, the device will resume correct operation from the point at which it was halted.

## RS170 Default Register Values

The tables below show the values programmed for the RS170 Format (using a 14.31818 MHz clock signal) and how they compare against the actual EIA RS170 Specifications. The default signals that will be output are CSYNC, CBLANK, HDRIVE and VDRIVE. The device initially starts at the beginning of the odd field of interlace. All signals have active low pulses and the clock is disabled at power up. Registers 13 and 14 are not involved in the actual signal information. If the Vertical Interrupt was selected so that a pulse indicating the active lines would be output.

Reg	D Value H		Register Description
REG0	0	000	Status Register (715/LM1882)
REG0	1024	400	Status Register (715-R/LM1882-R)
REG1	23	017	HFP End Time
REG2	91	05B	HSYNC Pulse End Time
REG3	157	09D	HBLANK Pulse End Time
REG4	910	38E	Total Horizontal Clocks
REG5	7	007	VFP End Time
REG6	13	00D	VSYSNC Pulse End Time
REG7	41	029	VLANK Pulse End Time
REG8	525	20D	Total Vertical Lines

## Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ( $V_{CC}$ )	−0.5V to +7.0V
DC Input Diode Current ( $I_{IK}$ )	
$V_I = -0.5V$	−20 mA
$V_I = V_{CC} + 0.5V$	+20 mA
DC Input Voltage ( $V_I$ )	−0.5V to $V_{CC} + 0.5V$
DC Output Diode Current ( $I_{OK}$ )	
$V_O = -0.5V$	−20 mA
$V_O = V_{CC} + 0.5V$	+20 mA
DC Output Voltage ( $V_O$ )	−0.5V to $V_{CC} + 0.5V$
DC Output Source or Sink Current ( $I_O$ )	±15 mA
DC $V_{CC}$ or Ground Current per Output Pin ( $I_{CC}$ or $I_{GND}$ )	±20 mA
Storage Temperature ( $T_{STG}$ )	−65°C to +150°C

Junction Temperature ( $T_J$ )

Ceramic	175°C
Plastic	140°C

**Note 1:** Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature and output/input loading variables. National does not recommend operation of FACT™ circuits outside databook specifications.

## Recommended Operating Conditions

Supply Voltage ( $V_{CC}$ )	4.5V to 5.5V
Input Voltage ( $V_I$ )	0V to $V_{CC}$
Output Voltage ( $V_O$ )	0V to $V_{CC}$
Operating Temperature ( $T_A$ )	
74ACT	−40°C to +85°C
54ACT	−55°C to +125°C
Minimum Input Edge Rate ( $\Delta V/\Delta t$ )	
$V_{IN}$ from 0.8V to 2.0V	
$V_{CC}$ @ 4.5V, 5.5V	125 mV/ns

## Additional Applications Information

### POWERING UP

The 'ACT715/LM1882 default value for Bit 10 of the Status Register is 0. This means that when the CLEAR pulse is applied and the registers are initialized by loading the default values the CLOCK is disabled. Before operation can begin, Bit 10 must be changed to a 1 to enable CLOCK. If the default values are needed (no other programming is required) then Figure 5 illustrates a hardwired solution to facilitate the enabling of the CLOCK after power-up. Should control signals be difficult to obtain, Figure 6 illustrates a possible solution to automatically enable the CLOCK upon power-up. Use of the 'ACT715-R/LM1882-R eliminates the need for most of this circuitry. Modifications of the Figure 6 circuit can be made to obtain the lone CLEAR pulse still needed upon power-up.

Note that, although during a Vectored Restart none of the preprogrammed registers are affected, some signals are affected for the duration of one frame only. These signals are the Horizontal and Vertical Drive signals. After a Vectored Restart the beginning of these signals will occur at the first CLK. The end of the signals will occur as programmed. At the completion of the first frame, the signals will resume to their programmed start and end time.

### PREPROGRAMMING "ON-THE-FLY"

Although the 'ACT715/LM1882 and 'ACT715-R/LM1882-R are completely programmable, certain limitations must be set as to when and how the parts can be reprogrammed. Care must be taken when reprogramming any End Time registers to a new value that is lower than the current value. Should the reprogramming occur when the counters are at a count after the new value but before the old value, then the counters will continue to count up to 4096 before rolling over.

For this reason one of the following two precautions are recommended when reprogramming "on-the-fly". The first recommendation is to reprogram horizontal values during the horizontal blank interval only and/or vertical values during the vertical blank interval only. Since this would require delicate timing requirements the second recommendation may be more appropriate.

The second recommendation is to program a Vectored Restart as the final step of reprogramming. This will ensure that all registers are set to the newly programmed values and that all counters restart at the first CLK position. This will avoid overrunning the counter end times and will maintain the video integrity.

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

# LM224/A, LM324/A, LM2902 QUAD OPERATIONAL AMPLIFIER

## QUAD OPERATIONAL AMPLIFIERS

14 DIP

The LM224 series consists of four independent, high gain, internally frequency compensated operational amplifiers which were designed specifically to operate from a single power supply over a wide voltage range.

Operation from split power supplies is also possible so long as the difference between the two supplies is 3 volts to 32 volts.

Application areas include transducer amplifier, DC gain blocks and all the conventional OP amp circuits which now can be easily implemented in single power supply systems.

## FEATURES

- Internally frequency compensated for unity gain
- Large DC voltage gain: 100dB
- Wide power supply range: LM224/A, LM324/A: 3V ~32V (or  $\pm 1.5 \sim 15V$ )  
LM2902: 3V~26V (or  $\pm 1.5V \sim 13V$ )
- Input common-mode voltage range includes ground
- Large output voltage swing: 0V DC to  $V_{CC}-1.5V$  DC
- Power drain suitable for battery operation.

# LM336-2.5/B/LM236-2.5 (KA336-2.5, KA236-2.5) PROGRAMMABLE SHUNT REGULATOR

## PROGRAMMABLE SHUNT REGULATOR

The LM336-2.5/B integrated Circuits are precision 2.5V shunt regulators. The monolithic IC voltage references operates as a low temperature coefficient 2.5V zener with 0.2Ω dynamic impedance. A third terminal on the KA336-2.5/B allow the reference voltage and temperature coefficient to be trimmed easily. LM3362.5/B are useful as a precision 2.5V low voltage reference for digital voltmeters, power supplies or op amp circuitry. The 2.5V make it convenient to obtain a stable reference from low voltage supplies. Further, since the LM336-2.5/B operate as shunt regulators, they can be used as either a positive or negative voltage reference.

TO-92

1: Adj. 2: + 3: -

## FEATURES

- Low temperature coefficient
- Guaranteed temperature stability 4mV typical
- 0.2 Ω dynamic impedance
- ±1.0% initial tolerance available.
- Easily trimmed for minimum temperature drift

### QUAD DIFFERENTIAL COMPARATOR

The LM239 series consists of four independent voltage comparators designed to operate from single power supply over a wide voltage range.

### FEATURES

- Single or dual supply operation
- Wide range of supply voltage  
LM239/A, LM339/A, LM2901: 2 ~ 36V (or  $\pm 1 \sim \pm 18V$ )  
LM3302: 2 ~ 28V (or  $\pm 1 \sim \pm 14V$ )
- Low supply current drain 800 $\mu A$  Typ
- Open collector outputs for wired and connectors
- Low input bias current 25nA Typ
- Low Input offset current  $\pm 2.3nA$  Typ.
- Low input offset voltage  $\pm 1.4mV$  Typ.
- Common mode input voltage range includes ground.
- Low output saturation voltage
- Output compatible with TTL, DTL and MOS logic system

## QUAD OPERATIONAL AMPLIFIERS

The LM248/LM348 is a true quad LM741. It consists of four independent, high-gain, internally compensated, low-power operational amplifiers which have been designed to provide functional characteristics identical to those of the familiar LM741 operational amplifier. In addition the total supply current for all four amplifiers is comparable to the Supply current of a single LM741 type OP Amp.

Other features include input offset currents and input bias current which are much less than those of a standard LM741. Also, excellent isolation between amplifiers has been achieved by independently biasing each amplifier and using layout techniques which minimize thermal coupling.

## FEATURES

- LM741 OP Amp operating characteristics
- Low supply current drain
- Class AB output stage-no crossover distortion
- Pin compatible with the LM324 & LM3403
- Low input offset voltage: 1mV Typ.
- Low input offset current: 4nA Typ.
- Low input bias current: 30nA Typ.
- Gain bandwidth product for LM348 (unity gain): 1.0MHz Typ.
- High degree of isolation between amplifiers: 120dB
- Overload protection for inputs and outputs

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.

# LM258/A, LM358/A, LM2904 DUAL OPERATIONAL AMPLIFIER

## DUAL OPERATIONAL AMPLIFIERS

The LM258 series consists of four independent, high gain, internally Frequency compensated operational amplifiers which were designed specifically to operate from a single power supply over a wide range of voltage.

Operation from split power supplies is also possible and the low power Supply current drain is independent of the magnitude of the power Supply voltage. Application areas include transducer amplifier, DC gain blocks and all the conventional OP amp circuits which now can be easily implemented in single 8 SOP power supply system.

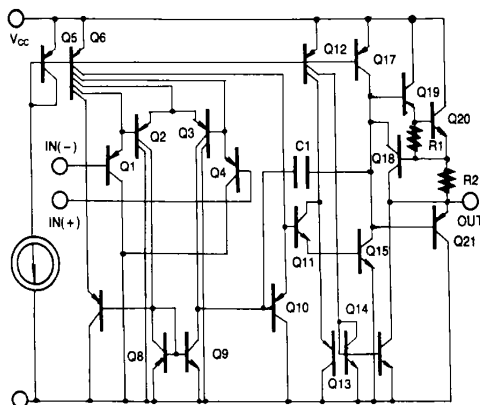

## FEATURES

- Internally frequency compensated for unity gain
- Large DC voltage gain: 100dB
- Wide power supply range: LM258/A, LM358/A: 3V~32V (or  $\pm 1.5V \sim 16V$ )  
LM2904: 3V~26V (or  $\pm 1.5V \sim 13V$ )
- Input common-mode voltage range Includes ground
- Large output voltage swing: 0V DC to  $V_{CC} - 1.5V$  DC
- Power drain suitable for battery operation.

## DUAL DIFFERENTIAL COMPARATOR

The LM/KA293 series consists of two independent voltage comparators designed to operate from a single power supply over a wide voltage range.

## FEATURES

- Single Supply Operation: 2V to 36V
- Dual Supply Operation:  $\pm 1V$  to  $\pm 18V$
- Allow Comparison of Voltages Near Ground Potential
- Low Current Drain 800 $\mu A$  Typ
- Compatible with all Forms of Logic
- Low Input Bias Current 25nA Typ
- Low Input Offset Current  $\pm 5nA$  WP
- Low Offset Voltage  $\pm 1mV$  Typ

**DUAL DIFFERENTIAL COMPARATOR**

8 DIP

The LM293 series consists of two independent voltage comparators designed to operate from a single power supply over a wide voltage range.

**FEATURES**

- Single Supply Operation: 2V to 36V
- Dual Supply Operation:  $\pm 1V$  to  $\pm 18V$
- Allow Comparison of Voltages Near Ground Potential
- Low Current Drain 800 $\mu A$  Typ
- Compatible with all Forms of Logic
- Low Input Bias Current 25nA Typ
- Low Input Offset Current  $\pm 5nA$  WP
- Low Offset Voltage  $\pm 1mV$  Typ

**VOLTAGE COMPARATOR**

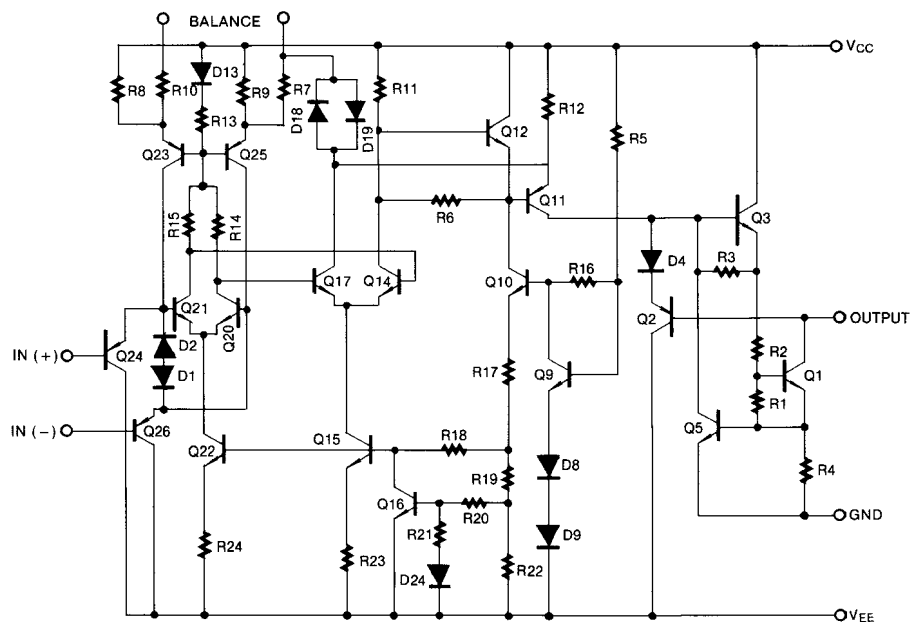

The LM311 series is a monolithic, low input current voltage comparator.  
The device is also designed to operate from dual or single supplies voltage

**FEATURE**

- Low input bias current : 250nA (Max)
- Low input offset current : 50nA (Max)
- Differential Input Voltage :  $\pm 30V$ .
- Power supply voltage : single 5.0V supply to  $\pm 15V$ .
- Offset voltage null capability.
- Strobe capability.

**3-TERMINAL 0.1A POSITIVE ADJUSTABLE REGULATOR**

The LM317L is a 3-terminal adjustable positive voltage regulator capable of supplying in excess of 100mA over an output voltage range of 1.2V to 37V. This voltage regulator is exceptionally easy to use and requires only two external resistors to set the output voltage.

**FEATURES**

- Output current in excess of 100mA
- Output adjustable between 1.2V and 37V
- Internal thermal-overload protection
- Internal short-circuit current-limiting
- Output transistor safe-area compensation
- Floating operation for high-voltage applications

# LM337 (KA337) ADJUSTABLE VOLTAGE REGULATOR (NEGATIVE)

## 3-TERMINAL 1.5A NEGATIVE ADJUSTABLE REGULATOR

The LM337 is a 3-terminal negative adjustable regulator. It supply in excess of 1.5A over an output voltage range of -1.2V to -37V. This regulator requires only two external resistor to set the output voltage. Included on the chip are current limiting, thermal overload protection and safe area compensation.

### FEATURES

- Output current in excess of 1.5A
- Output voltage adjustable between -1.2V and -37V
- Internal thermal-overload protection
- Internal short-circuit current limiting
- Output transistor safe-area compensation
- Floating operation for high-voltage applications
- Standard 3-pin TO-220 package

**DUAL OPERATIONAL AMPLIFIER**

The LF353 is a JFET input operational amplifier with an internally compensated input offset voltage. The JFET input device provides with bandwidth, low input bias currents and offset currents.

**FEATURES**

- Internally trimmed offset voltage: 10mV
- Low input bias current: 50pA
- Wide gain bandwidth: 4MHz
- High slew rate: 13V/μs
- High Input impedance:  $10^{12}\Omega$

## SINGLE TIMER

The LM555/I is a highly stable controller capable of producing accurate timing pulses. With monostable operation, the time delay is controlled by one external and one capacitor. With astable operation, the frequency and duty cycle are accurately controlled with two external resistors and one capacitor.

## FEATURES

- High Current Drive Capability (= 200mA)
- Adjustable Duty Cycle
- Temperature Stability of 0.005%/°C
- Timing From  $\mu$ Sec To Hours
- Turn Off Time Less Than 2 $\mu$ Sec

## APPLICATIONS

- Precision Timing
- Pulse Generation
- Time Delay Generation
- Sequential Timing

Reset Voltage	$V_{RST}$		0.4	0.7	1.0	V
Reset Current	$I_{RST}$			0.1	0.4	mA

## SINGLE TIMER

(T<sub>A</sub> = 25°C, V<sub>CC</sub> = 5 ~ 15V, unless otherwise specified)

Notes:

1. Supply current when output is high is typically 1mA less at  $V_{CC} = 5V$
2. Tested at  $V_{CC} = 5.0V$  and  $V_{CC} = 15V$
3. This will determine maximum value of  $R_A + R_B$  for 15V operation, the max. total  $R = 20M\Omega$ , and for 5V operation the max. total  $R = 6.7M\Omega$

[illegible]

**APPLICATION NOTE**

The application circuit shows astable mode.

Pin 6 (threshold) is tied to Pin 2 (trigger) and Pin 4 (reset) is tied to  $V_{CC}$  (Pin 8).

The external capacitor  $C_1$  of Pin 6 and Pin 2 charges through  $R_A$ ,  $R_B$  and discharges through  $R_B$  only.

In the internal circuit of the LM555 one input of the upper comparator is the  $2/3 V_{CC}$  ( $*R_1 = R_2 = R_3$ , another input if it is connected Pin 6).

As soon as charging  $C_1$  is higher than  $2/3 V_{CC}$ , discharge transistor  $Q_1$  turns on and  $C_1$  discharges to collector of transistor  $Q_1$ .

Therefore, the flip-flop circuit is reset and output is low.

One input of lower comparator is the  $1/3 V_{CC}$ , discharge transistor  $Q_1$  turn off and  $C_1$  charges through  $R_A$  and  $R_B$ .

Therefore, the flip-flop circuit is set and output is high.

So to say, when  $C_1$  charges through  $R_A$  and  $R_1$  output is high and when  $C_1$  discharges through  $R_B$  output is low.

The charge time (output is high)  $T_1$  is  $0.693 (R_A + R_B) C_1$  and the discharge time (output is low)  $T_2$  is  $0.693 (R_B C_1)$ .

$$(I_n \frac{V_{CC}-1/3V_{CC}}{V_{CC}-2/3V_{CC}}) (0.693)$$

Thus the total period time  $T$  is given by

$$T = T_1 + T_2 = 0.693 (R_A + 2R_B) C_1.$$

Then the frequency of astable mode is given by

$$f = \frac{1}{T} = \frac{1.44}{(R_A + 2R_B)C_1}$$

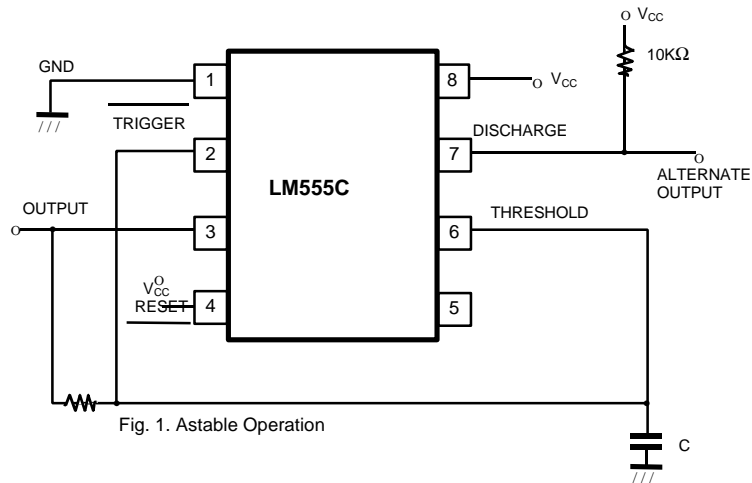

The duty cycle is given by

$$D.C = \frac{T_H}{T} = \frac{R_B}{R_A + 2R_B}$$

If you make use of the LM556 you can make two astable modes.

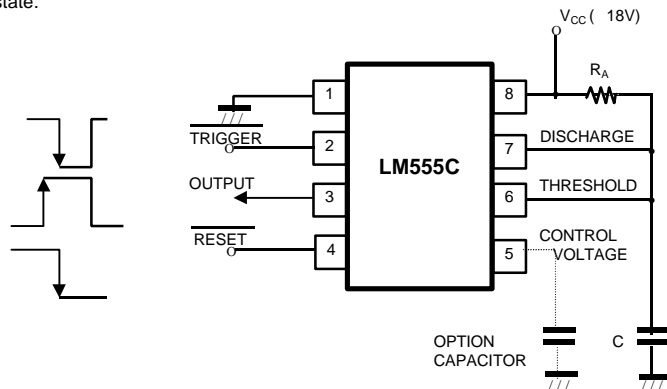

### Astable Operation

The LM555 can free run as a multivibrator by triggering itself; refer to Fig.2. The output can swing from  $V_{DD}$  to GND and have 50% duty cycle square wave. Less than 1% frequency deviation can be observed, over a voltage range of 2 to 5V.  $f = 1/1.4RC$

### Monostable Operation

The LM555 can be used as a one-shot, i.e. monostable multivibrator. Initially, because the inside discharge transistor is on state, external timing capacitor is held to GND potential. Upon application of a negative TRIGGER pulse pin 2, the internal discharge transistor is off state and the voltage across the capacitor increases with time constant  $T = R_A C$  and OUTPUT goes to high state. When the voltage across the capacitor equals  $2/3 V_{CC}$  the inner comparator is reset by THRESHOLD input and the discharge transistor goes to on state, which in turn discharges the capacitor rapidly and drives the OUTPUT to its low state.

## DUAL TIMER

The LM556/I series dual monolithic timing circuits are a highly stable controller capable of producing accurate time delays or oscillation. The LM556 is a dual LM555. Timing is provided an external resistor and capacitor for each timing function.

The two timers operate independently of each other, sharing only  $V_{CC}$  and ground.

The circuits may be triggered and reset on falling wave forms. The output structures may sink or source 200mA.

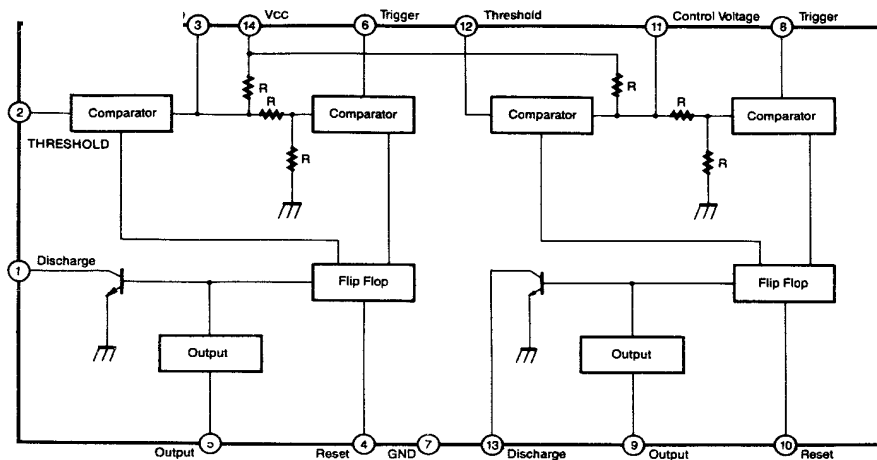

## FEATURES

- Replaces Two LM555C Timers
- Operates in Both Astable and Monostable Modes
- High Output Current
- TTL Compatible
- Timing From Microsecond to Hours
- Adjustable Duty Cycle
- Temperature Stability Of 0.005% Per °C

## APPLICATIONS

- Precision Timing
- Pulse Shaping
- Pulse Width Modulation
- Frequency Division
- Traffic Light Control
- Sequential Timing
- Pulse Generator
- Time Delay Generator
- Touch Tone Encoder
- Tone Burst Generator

Discharge Leakage Current	I <sub>LKG</sub>			10	100	nA
*4 Matching Characteristics						
Initial Accuracy	ACCUR			1.0	2.0	%
Drift with Temperature	Δt/ΔT			10		ppm/°C
Drift with Supply Voltage	Δt/ΔV <sub>CC</sub>			0.2	0.5	%/V
*2 Timing Error (astable)						
Initial Accuracy	ACCUR	R <sub>A</sub> , R <sub>B</sub> = 1kΩ to 100kΩ C = 0.1μF V <sub>CC</sub> = 15V		2.25		%
Drift with Temperature	Δt/ΔT			150		ppm/°C
Drift with Supply Voltage				0.3		%/V

## Notes:

- \*1. Supply current when output is high is typically 1.0mA less at V<sub>CC</sub> = 5V
- \*2. Tested at V<sub>CC</sub> = 5V and V<sub>CC</sub> = 15V
- \*3. This will determine the maximum value of R<sub>A</sub> + R<sub>B</sub> for 15V operation.  
The maximum total R = 20MΩ, and for 5V operation the maximum total R = 6.6MΩ.
- \*4. Matching characteristics refer to the difference between performance characteristics of each timer section in the monostable mode.
- \*5. As reset voltage lowers, timing is inhibited and then the output goes low.

## HIGH SPEED VOLTAGE COMPARATOR

The LM710/I is a high speed voltage comparator intended for use as an accurate, low-level digital level sensor or as a replacement for operational amplifiers in comparator applications where speed is of prime importance.

The output of the comparator is compatible with all integrated logic forms.

The LM710/I is useful as pulse height discriminators, a variable threshold Schmitt trigger, voltage comparator in high-speed A/D converters, a memory sense amplifier or a high noise immunity line receiver.

## FEATURES

- Low offset voltage: 5mV
- High gain: 1000 V/V
- High speed: 40ns Typ

## DUAL HIGH-SPEED DIFFERENT COMPARATOR

The LM711/I consists of two voltage comparators with the separate differential inputs, a common output and provision for strobing each side independently. The device features high accuracy, fast response, low offset voltage, a large input voltage range, low power consumption and compatibility with practically all integrated logic forms.

The LM711/I can be used as a sense amplifier for memories, and a dual comparator with OR'ed outputs is required, such as a double-ended limit detector.

## FEATURES

- Fast response time: 40ns (Typ)
- Output compatible with most TTL circuits
- Independent strobing of each comparator
- Low offset voltage

## SINGLE OPERATIONAL AMPLIFIERS

The LM741 series are general purpose operational amplifiers which feature improved performance over industry standards like the LM709. It is intended for a wide range of analog applications. The high gain and wide range of operating voltage provide superior performance in integrator, summing amplifier, and general feedback applications.

## FEATURES

- Short circuit protection
- Excellent temperature stability
- Internal frequency compensation
- High Input voltage range
- Null of offset

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.

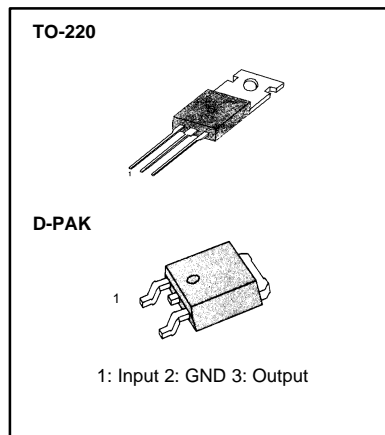

# LM78XX (KA78XX, MC78XX) FIXED VOLTAGE REGULATOR (POSITIVE)

## 3-TERMINAL 1A POSITIVE VOLTAGE REGULATORS

The LM78XX series of three-terminal positive regulators are available in the TO-220/D-PAK package and with several fixed output voltages, making them useful in a wide range of applications. Each type employs internal current limiting, thermal shut-down and safe area protection, making it essentially indestructible. If adequate heat sinking is provided, they can deliver over 1A output current. Although designed primarily as fixed voltage regulators, these devices can be used with external components to obtain adjustable voltages and currents.

## FEATURES

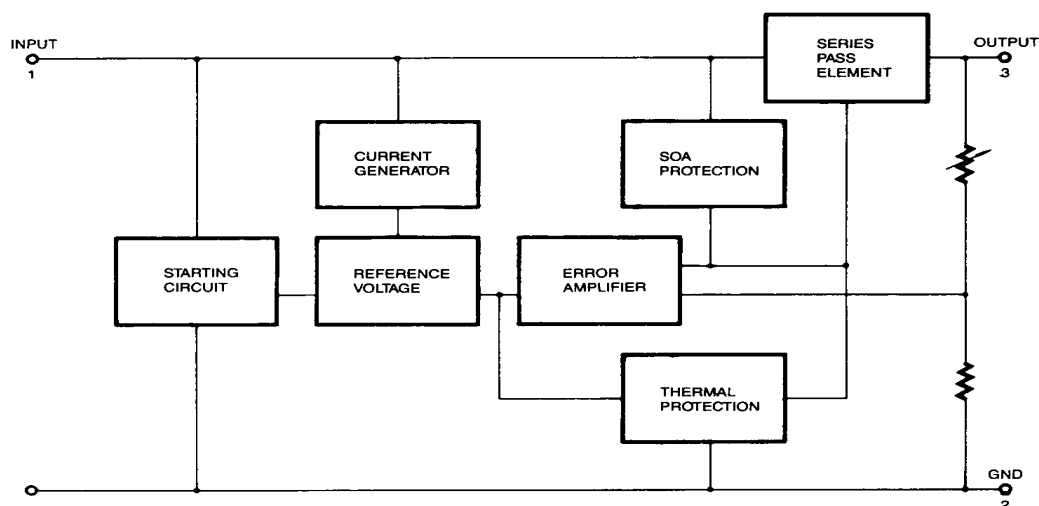

- Output Current up to 1A
- Output Voltages of 5, 6, 8, 9, 10, 11, 12, 15, 18, 24V
- Thermal Overload Protection
- Short Circuit Protection
- Output Transistor SOA Protection

## ORDERING INFORMATION

Device	Output Voltage Tolerance	Packag	Operating Temperature
KA78XXCT	± 4%	TO-220	0 ~ +125 °C
KA78XXAT	± 2%		-40 ~ +125 °C
KA78XXIT	± 4%		
KA78XXR	± 2%	D-PAK	0 ~ +125 °C
KA78XXAR	± 2%		-40 ~ +125 °C

Fig. 8 Fixed Output Regulator

Fig. 9 Constant Current Regulator

### Notes:

- (1) To specify an output voltage, substitute voltage value for "XX."  
A common ground is required between the input and the Output voltage. The input voltage must remain typically 2.0V above the output voltage even during the low point on the input ripple voltage.
- (2)  $C_I$  is required if regulator is located an appreciable distance from power Supply filter.
- (3)  $C_O$  improves stability and transient response.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.

# LM78LXX (KA78LXX, MC78LXX) FIXED VOLTAGE REGULATOR (POSITIVE)

## 3-TERMINAL 0.1A POSITIVE VOLTAGE REGULATORS

The LM78LXX series of fixed voltage monolithic integrated circuit voltage regulators are suitable for application that required supply up to 100mA.

## FEATURES

- Maximum Output Current of 100mA
- Output Voltage of 5V, 6V, 8V, 9V, 10V, 12V, 15V, 18V and 24V
- Thermal Overload Protection
- Short Circuit Current Limiting
- Output Voltage Offered in  $\pm 5\%$  Tolerance

#### Notes

- The maximum steady state usable output current and input voltage are very dependent on the heat sinking and/or lead length of the package. The data above represent pulse test conditions with junction temperature as indicated at the initiation of tests.
- Power dissipation  $\leq 0.75W$ .

## LM78LXX (KA78LXX, MC78LXX) FIXED VOLTAGE REGULATOR (POSITIVE)

---

### TYPICAL APPLICATION

#### Notes

1. To specify an output voltage, substitute voltage value for "XX".
2. Bypass Capacitors are recommend for optimum stability and transient response and should be located as close as possible to the regulator

# MC78MXX (LM78MXX) (KA78MXX)

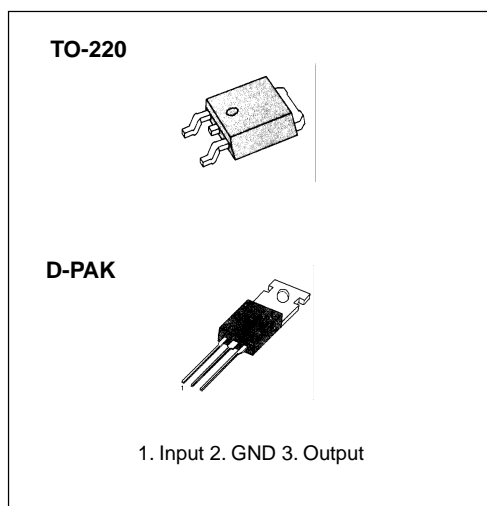

## 3-Terminal 0.5A Positive Voltage Regulators

### Features

- Output Current up to 0.5A
- Output Voltages of 5, 6, 8, 10, 12, 15, 18, 20, 24V
- Thermal Overload Protection
- Short Circuit Protection
- Output Transistor SOA Protection
- Industrial and commercial temperature range

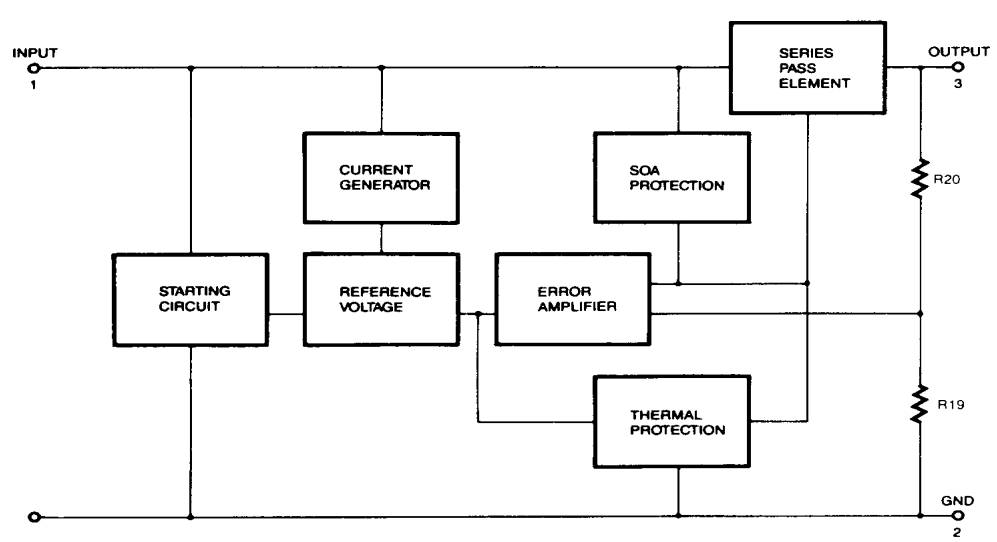

### Description

The MC78MXX (LM78MXX) (KA78MXX) series of three-terminal positive regulators are available in the TO-220/D-PAK package with several fixed output voltages making it useful in a wide range of applications.

Fixed Voltage Regulator (Positive)

Typical Applications

Figure 1. Fixed Output Regulator

Figure 2. Constant Current Regulator

- Notes:
- 1. To specify an output voltage, substitute voltage value for "XX"
  - 2. Although no output capacitor is needed for stability, it does improve transient response.
  - 3. Required if regulator is located an appreciable distance from power Supply filter

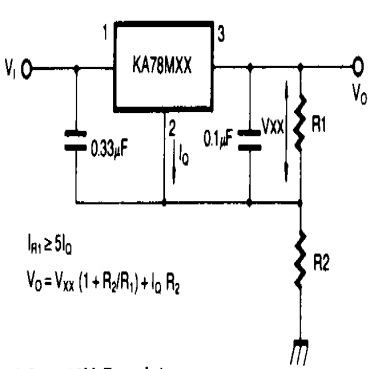

Figure 3. Circuit for Increasing Output Voltage

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

### 3-TERMINAL 0.5A POSITIVE VOLTAGE REGULATORS

The LM78MXXC/I series of three-terminal positive regulators are available in the TO-220 package with several fixed output voltages making it useful in a wide range of applications.

#### FEATURES

- Output Current up to 0.5A
- Output Voltages of 5; 6; 8; 10; 12; 15; 18; 20; 24V
- Thermal Overload Protection
- Short Circuit Protection
- Output Transistor SOA Protection
- Industrial and commercial temperature range

TO-220

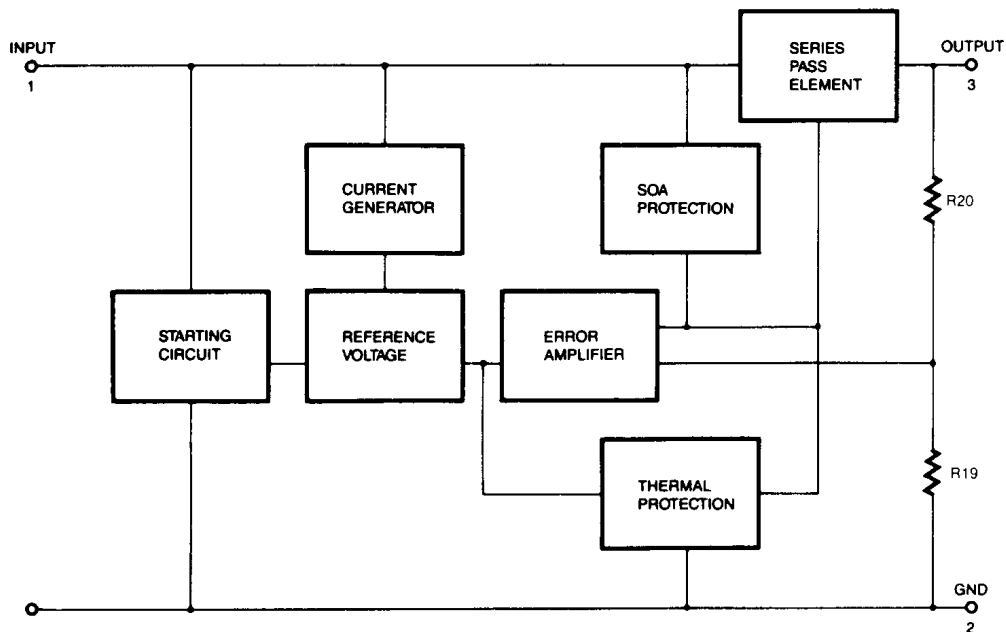

1:Input 2: GND 3: Output

#### ORDERING INFORMATION

Device	Package	Operating Temperature
LM78MXXT	TO-220	0 ~ + 125°C
LM78MXXIT	TO-220	- 40 ~ +125°C

## APPLICATION CIRCUIT

Fig. 1 Fixed output regulator

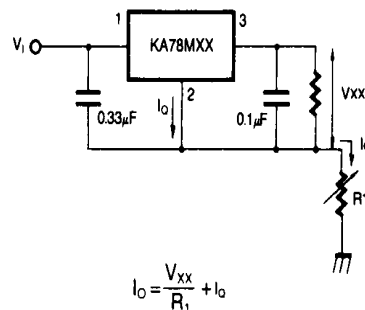

Fig. 2 Constant current regulator

## Notes:

- (1) To specify an output voltage, substitute voltage value for "XX".
- (2) Although no output capacitor is needed for stability, it does improve transient response.
- (3) Required if regulator is located an appreciable distance from power supply filter.

## TRADEMARKS

The following are registered and unregistered trademarks Fairchild Semiconductor owns or is authorized to use and is not intended to be an exhaustive list of all such trademarks.

ACE <sup>x</sup> ™	ISOPPLANAR™
CoolFET™	MICROWIRE™
CROSSVOLT™	POP™
E <sup>2</sup> CMOS™	PowerTrench™
FACT™	QS™
FACT Quiet Series™	Quiet Series™
FAST®	SuperSOT™-3
FAST <sub>r</sub> ™	SuperSOT™-6
GTO™	SuperSOT™-8
HiSeC™	TinyLogic™

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.

## LM79XX/A (KA79XX, MC79XX) FIXED VOLTAGE REGULATOR (NEGATIVE)

### 3-TERMINAL 1A NEGATIVE VOLTAGE REGULATORS

The LM79XX series of three-terminal negative regulators are available in TO-220 package and with several fixed output voltages, making them useful in a wide range of applications. Each type employs internal current limiting, thermal shut-down and safe area protection, making it essentially indestructible.

### FEATURES

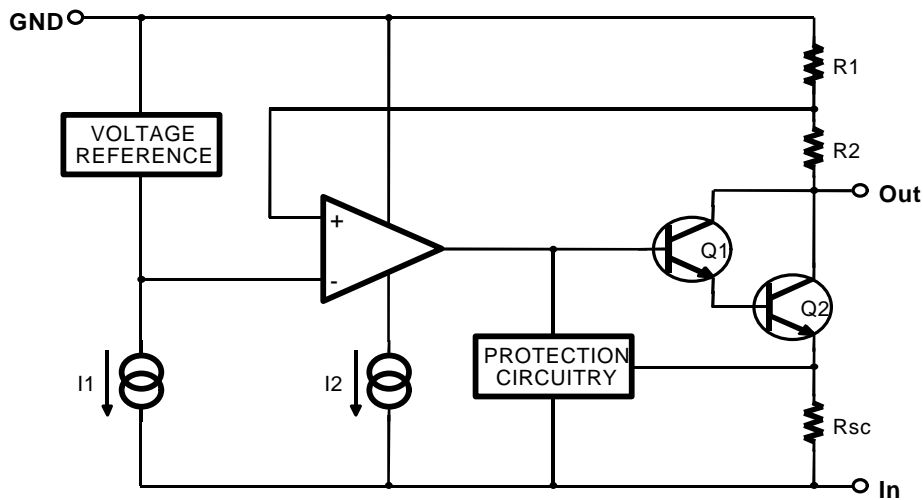

- Output Current in Excess of 1A
- Output Voltages of -5, -6, -8, -12, -15, -18, -24V
- Internal Thermal Overload Protection
- Short Circuit Protection
- Output Transistor Safe-Area Compensation

### ORDERING INFORMATION

Device	Output Voltage Tolerance	Package	Operating Temperature
LM79XXCT	$\pm 4\%$	TO-220	0 ~ +125 °C
LM79XXAT	$\pm 2\%$		

### BLOCK DIAGRAM

## LM79XX/A (KA79XX, MC79XX) FIXED VOLTAGE REGULATOR (NEGATIVE)

### ABSOLUTE MAXIMUM RATINGS (T<sub>A</sub>=+25°C, unless otherwise specified)

Characteristic	Symbol	Value	Unit
Input Voltage	V <sub>I</sub>	-35	V
Thermal Resistance Junction-Cases	R <sub>θJC</sub>	5	°C / W
Junction-Air	R <sub>θJA</sub>	65	°C / W
Operating Temperature Range	T <sub>OPR</sub>	0 ~ +125	°C
Storage Temperature Range	T <sub>STG</sub>	- 65 ~ +150	°C

### LM7905 ELECTRICAL CHARACTERISTICS

(V<sub>I</sub> = 10V, I<sub>O</sub> = 500mA, 0°C ≤ T<sub>J</sub> ≤ +125°C, C<sub>I</sub> = 2.2μF, C<sub>O</sub> = 1μF, unless otherwise specified.)

Characteristic	Symbol	Test Conditions	Min	Typ	Max	Unit
Output Voltage	V <sub>O</sub>	T <sub>J</sub> = +25°C	- 4.8	- 5.0	- 5.2	V
		I <sub>O</sub> = 5mA to 1A, P <sub>O</sub> 15W V <sub>I</sub> = -7 to -20V	- 4.75	- 5.0	- 5.25	
Line Regulation	ΔV <sub>O</sub>	T <sub>J</sub> = 25°C		5	50	mV
		V <sub>I</sub> = -7 to -20V I <sub>O</sub> = 1A		2	25	
		V <sub>I</sub> = -8 to -12V I <sub>O</sub> = 1A		7	50	
		V <sub>I</sub> = -7.5 to -25V		7	50	
Load Regulation	ΔV <sub>O</sub>	I <sub>O</sub> = 5mA to 1.5A		10	100	mV
		T <sub>J</sub> = +25°C I <sub>O</sub> = 250 to 750mA		3	50	
Quiescent Current	I <sub>Q</sub>	T <sub>J</sub> = +25°C		3	6	mA
Quiescent Current Change	ΔI <sub>Q</sub>	I <sub>O</sub> = 5mA to 1A		0.05	0.5	mA
		V <sub>I</sub> = -8 to -25V		0.1	0.8	
Temperature Coefficient of V <sub>O</sub>	ΔV <sub>O</sub> /ΔT	I <sub>O</sub> = 5mA		- 0.4		mV/°C
Output Noise Voltage	V <sub>N</sub>	f = 10Hz to 100KHz T <sub>A</sub> = +25°C		40		μV
Ripple Rejection	RR	f = 120Hz, I <sub>O</sub> = -35V ΔV <sub>I</sub> = 10V	54	60		dB
Dropout Voltage	V <sub>D</sub>	T <sub>J</sub> = +25°C I <sub>O</sub> = 1A		2		V
Short Circuit Current	I <sub>SC</sub>	T <sub>J</sub> = +25°C, V <sub>I</sub> = -35V		300		mA
Peak Current	I <sub>PK</sub>	T <sub>J</sub> = +25°C		2.2		A

\* Load and line regulation are specified at constant junction temperature. Changes in V<sub>O</sub> due to heating effects must be taken into account separately. Pulse testing with low duty is used.

## LM79XX/A (KA79XX, MC79XX) FIXED VOLTAGE REGULATOR (NEGATIVE)

### LM7906 ELECTRICAL CHARACTERISTICS

## LM79XX/A (KA79XX, MC79XX) FIXED VOLTAGE REGULATOR (NEGATIVE)

Fig. 6 Negative Fixed output regulator

**Notes:**

- (1) To specify an output voltage, substitute voltage value for "XX".
- (2) Required for stability. For value given, capacitor must be solid tantalum. If aluminum electrolytics are used, at least ten times value shown should be selected.  $C_i$  is required if regulator is located an appreciable distance from power supply filter.
- (3) To improve transient response. If large capacitors are used, a high current diode from input to output (1N4001 or similar) should be introduced to protect the device from momentary input short circuit.

**3-TERMINAL 0.1A NEGATIVE VOLTAGE REGULATORS**

These regulators employ internal current limiting and thermal shutdown, making them essentially indestructible.

**FEATURES**

- Output current up to 100mA
- No external components
- Internal thermal over load protection
- Internal short circuit current limiting
- Output Voltage Offered in  $\pm 5\%$  Tolerance
- Output Voltage of -5V, -12V, -15V, -18V and -24V

## TYPICAL APPLICATIONS

## Design Considerations

The MC79LXXA Series of fixed voltage regulators are designed with Thermal Overload Protection that shuts down the circuit when subjected to an excessive power overload condition. Internal Short-Circuit Protection that limits the maximum current the circuit will pass.

In many low current applications, compensation capacitors are not required. However, it is recommended that the regulator input be bypassed with a capacitor if the regulator is connected to the power supply filter with long wire lengths, or if the output load capacitance is large. An input bypass

capacitor should be selected to provide good high - frequency characteristics to insure stable operation under all load conditions. A  $0.33\mu\text{F}$  or larger tantalum, mylar, or other capacitor having low internal impedance at high frequencies should be chosen. The bypass capacitor should be mounted with the shortest possible leads directly across the regulator's input terminals. Normally good construction techniques should be used to minimize ground loops and lead resistance drops since the regulator has no external sense lead. Bypassing the output is also recommended.

Fig. 1 Positive And Negative Regulator

Fig. 2 Typical Application

A common ground is required between the Input and the output voltages. The input voltage must remain typically 2.0V above the output voltage even during the low point on the input ripple voltage.

=  $C_1$  is required if regulator is located an appreciable distance from power supply filter.

\*\* =  $C_0$  improves stability and transient response.

## 3-TERMINAL 0.5A NEGATIVE VOLTAGE REGULATORS

The LM79MXX series of 3-Terminal medium current negative voltage regulators are monolithic integrated circuits designed as fixed voltage regulators. These regulators employ internal current limiting, thermal shutdown and safe-area compensation making them essentially indestructible.

TO-220

D-PAK

1: GND 2: Input 3: Output

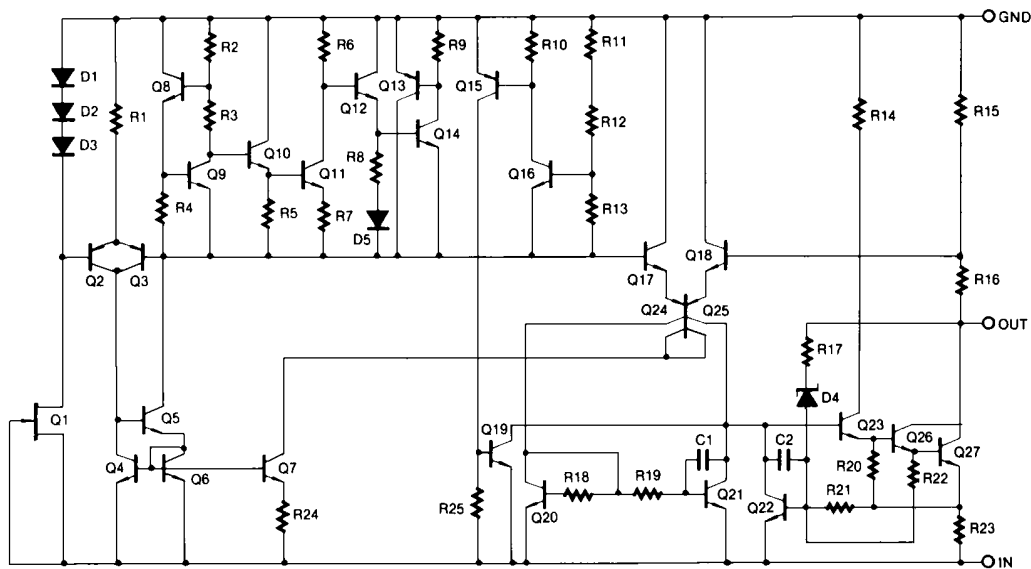

## FEATURES

- No external components required
- Output current in excess of 0.5A
- Internal thermal-overload
- Internal short circuit current limiting
- Output transistor safe-area compensation
- Output Voltages of -5V, -6V, -8V, -12V, -15V, -18V and -24V

## ORDERING INFORMATION

## TYPICAL APPLICATIONS

Bypass capacitors are recommended for stable operation of the KA79MXX series of regulators over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

The bypass capacitors, (2μF on the input, 1μF on the output) should be ceramic or solid tantalum which have good high frequency characteristics. If aluminum electrolytics are used, their values should be 10μF or larger. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.

Fig. 1 Fixed Output Regulator

Fig. 2 Variable Output

**Note**

1. Required for stability. For value given, capacitor must be solid tantalum. 25μF aluminum electrolytic may be substituted.
2. C<sub>2</sub> improves transient response and ripple rejection. Do not increase beyond 50μF.

$$V_{OUT} = V_{SET} \left( \frac{R_1 + R_2}{R_1} \right)$$

Select R<sub>2</sub> as follows

KA79M 05: 300Ω, KA79M12: 750Ω, KA79M15: 11Ω

## TRADEMARKS

The following are registered and unregistered trademarks Fairchild Semiconductor owns or is authorized to use and is not intended to be an exhaustive list of all such trademarks.

ACEx™	ISOPLANAR™
CoolFET™	MICROWIRE™
CROSSVOLT™	POP™
E <sup>2</sup> CMOS™	PowerTrench™
FACT™	QS™

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.

### 3-TERMINAL 0.5A NEGATIVE VOLTAGE REGULATORS

The KA79MXX series of 3-Terminal medium current negative voltage regulators are monolithic integrated circuits designed as fixed voltage regulators. These regulators employ internal current limiting, thermal shutdown and safe-area compensation making them essentially indestructible.

### FEATURES

- No external components required
- Output current in excess of 0.5A
- Internal thermal-overload
- Internal short circuit current limiting
- Output transistor safe-area compensation
- Output Voltages of -5V, -6V, -8V, -12V, -15V, -18V and -24V

TO-220

D-PAK

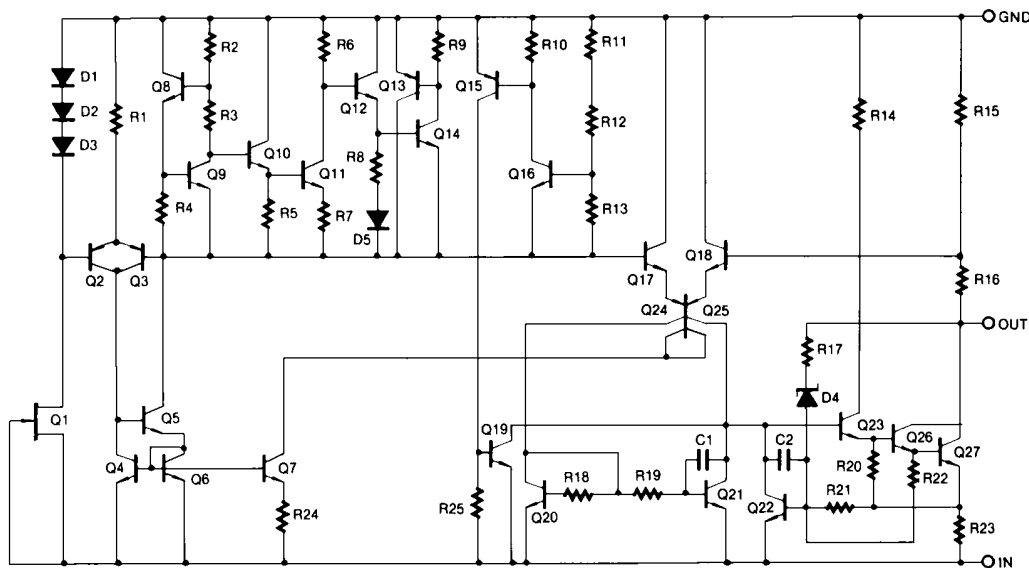

1: GND 2: Input 3: Output

### ORDERING INFORMATION

## TYPICAL APPLICATIONS

Bypass capacitors are recommended for stable operation of the KA79MXX series of regulators over the input voltage and output current ranges. Output bypass capacitors will improve the transient response of the regulator.

The bypass capacitors, (2μF on the input, 1μF on the output) should be ceramic or solid tantalum which have good high frequency characteristics. If aluminum electrolytics are used, their values should be 10μF or larger. The bypass capacitors should be mounted with the shortest leads, and if possible, directly across the regulator terminals.

Fig. 1 Fixed Output Regulator

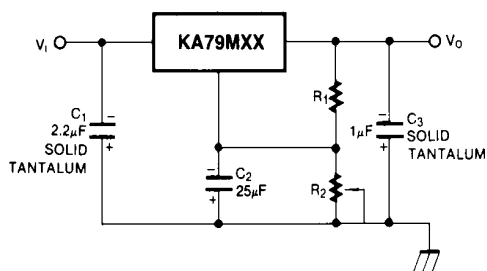

Fig. 2 Variable Output

**Note**

1. Required for stability. For value given, capacitor must be solid tantalum. 25μF aluminum electrolytic may be substituted.
2. C<sub>2</sub> improves transient response and ripple rejection. Do not increase beyond 50μF.

$$V_{OUT} = V_{SET} \left( \frac{R_1 + R_2}{R_1} \right)$$

Select R<sub>2</sub> as follows

KA79M 05: 300Ω, KA79M12: 750Ω, KA79M15: 11Ω

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## PRODUCT STATUS DEFINITIONS

### Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data, and supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice in order to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild semiconductor. The datasheet is printed for reference information only.
