## Quad Low Power Operational Amplifiers

The LM124 series are low-cost, quad operational amplifiers with true differential inputs. These have several distinct advantages over standard operational amplifier types in single supply applications. The quad amplifier can operate at supply voltages as low as 3.0 V or as high as 32 V with quiescent currents about one fifth of those associated with the MC1741 (on a per amplifier basis). The common mode input range includes the negative supply, thereby eliminating the necessity for external biasing components in many applications. The output voltage range also includes the negative power supply voltage.

- Short Circuited Protected Outputs
- True Differential Input Stage
- Single Supply Operation: 3.0 V to 32 V
- Low Input Bias Currents: 100 nA Max (LM324A)
- Four Amplifiers Per Package
- Internally Compensated
- Common Mode Range Extends to Negative Supply
- Industry Standard Pinouts
- ESD Clamps on the Inputs Increase Ruggedness without Affecting Device Operation

### MAXIMUM RATINGS ( $T_A = +25^\circ\text{C}$ , unless otherwise noted.)

NOTES: 1. T <sub>low</sub> = -35°C for LM124 = -25°C for LM224 = -25°C for LM324 = 0°C for LM324-A = -40°C for LM2902	T <sub>high</sub>	=	+125°C for LM124 = +85°C for LM224 = +70°C for LM324-A = +105°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902	=	+25°C for LM124 = +30°C for LM224 = +30°C for LM324-A = +40°C for LM2902
2. The input common mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3 V. The upper and/or the common mode voltage range is V <sub>CC</sub> - 1.7 V.																	
3. Short circuits from the output to V <sub>CC</sub> can cause excessive heating and eventual destruction. Destructive designation can result from simultaneous shorts on all amplifiers.

**Representative Circuit Schematic**  
(One-Fourth of Circuit Shown)

## CIRCUIT DESCRIPTION

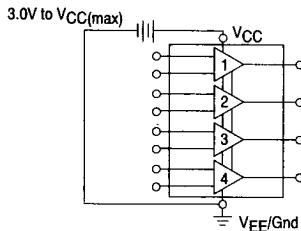

The LM124 series is made using four internally compensated, two-stage operational amplifiers. The first stage of each consists of differential input devices Q20 and Q18 with input buffer transistors Q21 and Q17 and the differential to single ended converter Q3 and Q4. The first stage performs not only the first stage gain function but also performs the level shifting and transconductance reduction functions. By reducing the transconductance a smaller compensation capacitor (only 5.0 pF) can be employed, thus saving chip area. The transconductance reduction is accomplished by splitting the collectors of Q20 and Q18. Another feature of this input stage is that the input common mode range can include the negative supply or ground, in single supply operation, without saturating either the input devices or the differential to single-ended converter. The second stage consists of a standard current source load amplifier stage.

## Large Signal Voltage Follower Response

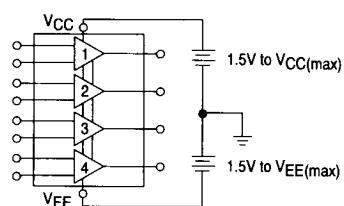

Each amplifier is biased from an internal-voltage regulator which has a low temperature coefficient thus giving each amplifier good temperature characteristics as well as excellent power supply rejection.

Given:  $f_0$  = center frequency  
 $A(f_0)$  = gain at center frequency

Choose value  $f_0$ ,  $C$

Then:

$$R_3 = \frac{Q}{\pi f_0 C}$$

$$R_1 = \frac{R_3}{2 A(f_0)}$$

$$R_2 = \frac{R_1 R_3}{4 Q^2 R_1 - R_3}$$

For less than 10% error from operational amplifier,

$$\frac{Q_0 f_0}{BW} < 0.1 \quad \text{where } f_0 \text{ and BW are expressed in Hz.}$$

If source impedance varies, filter may be preceded with voltage follower buffer to stabilize filter parameters.
