64MBIT (4MBIT × 16) PAGE MODE DUAL WORK FLASH MEMORY

Table of Contents-

1. GENERAL DESCRIPTION

The W28F641, a 4-Plane Page Mode Dual Work (Simultaneous Read while Erase/Program) Flash memory, is a low power, high density, low cost, nonvolatile read/write storage solution for a wide range of applications. The product can be operated at V_{DD} = 2.7V to 3.6V and V_{PP} = 1.65V to 3.6V or 11.7V to 12.3V. Its low voltage operation capability greatly extends battery life for portable applications.

The W28F641 provides high performance asynchronous page mode. It allows code execution directly from Flash, thus eliminating time-consuming wait states. Furthermore, the configurative partitioning architecture allows flexible dual work operation.

The memory array block architecture utilizes Enhanced Data Protection features, and provides separate Parameter and Main Blocks that provide maximum flexibility for safe nonvolatile code and data storage.

Fast program capability is provided through the use of high speed Page Buffer Program. Special OTP (One Time Program) block provides an area to store permanent code such as a unique number.

2. FEATURES

- 64M Density with 16Bit I/O Interface
- High-Performance Reads
  - 80/35 nS 8-Word Page Mode
- Configurative 4-Plane Dual Work
  - Flexible Partitioning
  - Read operations during Block Erase or (Page Buffer) Program
  - Status Register for Each Partition
- Low Power Operation
  - 2.7V Read and Write Operations
  - V_{DDQ} for Input/Output Power Supply Isolation
  - Automatic Power Savings Mode Reduces I_{CCR} in Static Mode
- Enhanced Code + Data Storage
  - 5 μS Typical Erase/Program Suspends
- OTP (One Time Program) Block
  - 4-Word Factory-Programmed Area
  - 4-Word User-Programmable Area
- High Performance Program with Page Buffer
  - 16-Word Page Buffer
  - 5 μS/ Word (Typ.) at 12V V_{PP}
- Operating Temperature
  - -40°C to +85°C
- CMOS Process (P-type silicon substrate)
- Flexible Blocking Architecture
  - Eight 4k-word Parameter Blocks

- One hundred and twenty-seven 32k-word Main Blocks
- Top or Bottom Parameter Location
- Enhanced Data Protection Features
  - Individual Block Lock and Block Lock-Down with Zero-Latency
  - All blocks are locked at power-up or device reset
  - Absolute Protection with $V_{PP} \leq V_{PPLK}$
  - Block Erase, Full Chip Erase, (Page Buffer) Word Program Lockout during Power Transitions
- Automated Erase/Program Algorithms
  - 3.0V Low-Power 11 μS/ Word (Typ.) Programming
  - 12V No Glue Logic 9 μS/ Word (Typ.) Production Programming and 0.5s Erase (Typ.)
- Cross-Compatible Command Support
  - Common Flash Interface (CFI)
  - Basic Command Set
- Extended Cycling Capability
  - Minimum 100,000 Block Erase Cycles
- Chip-Size Packaging
  - 0.75 mm pitch 48-Ball TFBGA and 48-Pin TSOP
- ETOX™ Flash Technology

Table 1. Pin Descriptions

SYMBOL	TYPE	NAME AND FUNCTION
A0 − A21	INPUT	**ADDRESS INPUTS**: Inputs for addresses. 64M: A0 − A21.
DQ0 − DQ15	INPUT/ OUTPUT	**DATA INPUT/OUTPUTS**: Inputs data and commands during CUI (Command User Interface) write cycles, outputs data during memory array, status register, query code, identifier code and partition configuration register code reads. Data pins float to high impedance (High Z) when the chip or outputs are deselected. Data is internally latched during an erase or program cycle.
#CE	INPUT	**CHIP ENABLE**: Activates the device's control logic, input buffers, decoders and sense amplifiers. #CE-high (V_{IH}) deselects the device and reduces power consumption to standby levels.
#RESET	INPUT	**RESET**: When low (V_{IL}), #RESET resets internal automation and inhibits write operations, which provides data protection. #RESET-high (V_{IH}) enables normal operation. After power-up or reset mode, the device is automatically set to read array mode. #RESET must be low during power-up/down.
#OE	INPUT	**OUTPUT ENABLE**: Gates the device's outputs during a read cycle.
#WE	INPUT	**WRITE ENABLE**: Controls writes to the CUI and array blocks. Addresses and data are latched on the rising edge of #CE or #WE (whichever goes high first).
#WP	INPUT	**WRITE PROTECT**: When #WP is V_{IL}, locked-down blocks cannot be unlocked. Erase or program operation can be executed to the blocks which are not locked and not locked-down. When #WP is V_{IH}, lock-down is disabled.
V_{PP}	INPUT	**MONITORING POWER SUPPLY VOLTAGE:** V_{PP} is not used for power supply pin. With $V_{PP} \leq V_{PPLK}$, block erase, full chip erase, (page buffer) program or OTP program cannot be executed and should not be attempted. Applying 12V ±0.3V to V_{PP} provides fast erasing or fast programming mode. In this mode, V_{PP} is power supply pin. Applying 12V ±0.3V to V_{PP} during erase/program can only be done for a maximum of 1,000 cycles on each block. V_{PP} may be connected to 12V ±0.3V for a total of 80 hours maximum. Use of this pin at 12V beyond these limits may reduce block cycling capability or cause permanent damage.
V_{DD}	SUPPLY	**DEVICE POWER SUPPLY**: With $V_{DD} \leq V_{LKO}$, all write attempts to the flash memory are inhibited. Device operations at invalid V_{DD} voltage (see DC Characteristics) produce spurious results and should not be attempted.
V_{DDQ}	SUPPLY	**INPUT/OUTPUT POWER SUPPLY (2.7V to 3.6V)**: Power supply for all input/output pins.
V_{SS}	SUPPLY	**GROUND**: Do not float any ground pins.

Table 2. Simultaneous Operation Modes Allowed with Four Planes[1,2]

IF ONE PARTITION IS:	THEN THE MODES ALLOWED IN THE OTHER PARTITION IS:										
	Read Array	Read ID/OTP	Read Status	Read Query	Word Program	Page Buffer Program	OTP Program	Block Erase	Full Chip Erase	Program Suspend	Block Erase Suspend
Read Array	X	X	X	X	X	X		X		X	X
Read ID/OTP	X	X	X	X	X	X		X		X	X
Read Status	X	X	X	X	X	X	X	X	X	X	X
Read Query	X	X	X	X	X	X		X		X	X
Word Program	X	X	X	X							X
Page Buffer Program	X	X	X	X							X
OTP Program			X								
Block Erase	X	X	X	X							
Full Chip Erase			X								
Program Suspend	X	X	X	X							X
Block Erase Suspend	X	X	X	X	X	X				X	

Notes:

1. "X" denotes the operation available.

2. Configurative Partition Dual Work Restrictions:
   Status register reflects partition state, not WSM (Write State Machine) state - this allows a status register for each partition.
   Only one partition can be erased or programmed at a time - no command queuing.
   Commands must be written to an address within the block targeted by that command.

Notes:

1. The address A21 − A16 are shown in below table for reading the manufacturer code, device code, device configuration code and OTP data.

2. Bottom parameter device has its parameter blocks in the plane0 (The lowest address).
   Top parameter device has its parameter blocks in the plane3 (The highest address).

3. Block Address = The beginning location of a block address within the partition to which the Read Identifier Codes/OTP command (90H) has been written.
   DQ15 − DQ2 are reserved for future implementation.

4. PCRC = Partition Configuration Register Code.

5. OTP-LK = OTP Block Lock configuration.

6. OTP = OTP Block data.

Table 4. Identifier Codes and OTP Address for Read Operation on Partition Configuration[1]

PARTITION CONFIGURATION REGISTER[2]			ADDRESS (64M-bit device) [A21 − A16]

1	0	1	00H or 10H or 30H
1	1	1	00H or 10H or 20H or 30H

Notes:

1. The address to read the identifier codes or OTP data is dependent on the partition which is selected when writing the Read Identifier Codes/OTP command (90H).

2. Refer to Table 12 for the partition configuration register.

Write	4,5,6	V_{IH}	V_{IL}	V_{IH}	V_{IL}	X	X	DIN

Notes:

1. Refer to DC Characteristics. When $V_{PP} \leq V_{PPLK}$, memory contents can be read, but cannot be altered.

2. X can be V_{IL} or V_{IH} for control pins and addresses, and V_{PPLK} or $V_{PPH1/2}$ for V_{PP}. See DC Characteristics for V_{PPLK} and $V_{PPH1/2}$ voltages.

3. #RESET at $V_{SS} \pm 0.2V$ ensures the lowest power consumption.

4. Command writes involving block erase, (page buffer) program or OTP program are reliably executed when $V_{PP} = V_{PPH1/2}$ and $V_{DD} = 2.7V$ to 3.6V.
   Command writes involving full chip erase are reliably executed when $V_{PP} = V_{PPH1}$ and $V_{DD} = 2.7V$ to 3.6V.

5. Refer to Table 6 for valid DIN during a write operation.

6. Never hold #OE low and #WE low at the same timing.

7. Refer to Appendix for more information about query code.

OTP Program	2	9	Write	OA	C0H	Write	OA	OD
Set Partition configuration Register	2		Write	PCRC	60H	Write	PCRC	04H

Notes:

1. Bus operations are defined in Table 5.

2. All address which is written at the first bus cycle should be the same as the address which is written at the second bus cycle.
    X = Any valid address within the device.
    PA = Address within the selected partition.
    IA = Identifier codes address (See Table 3 and Table 4).
    QA = Query codes address. Refer to Appendix for details.
    BA = Address within the block being erased, set/cleared block lock bit or set block lock-down bit.
    WA = Address of memory location for the Program command or the first address for the Page Buffer Program command.
    OA = Address of OTP block to be read or programmed (See Figure 3).
    PCRC = Partition configuration register code presented on the address A0 − A15.

3. ID = Data read from identifier codes. (See Table 3 and Table 4).
    QD = Data read from query database. Refer to Appendix for details.
    SRD = Data read from status register. See Table 10 and Table 11 for a description of the status register bits.
    WD = Data to be programmed at location WA. Data is latched on the rising edge of #WE or #CE (whichever goes high first) during command write cycles.
    OD = Data within OTP block. Data is latched on the rising edge of #WE or #CE (whichever goes high first) during command write cycles.
    N-1 = N is the number of the words to be loaded into a page buffer.

4. Following the Read Identifier Codes/OTP command, read operations access manufacturer code, device code, block lock configuration code, partition configuration register code and the data within OTP block (See Table 3 and Table 4). The Read Query command is available for reading CFI (Common Flash Interface) information.

5. Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when #RESET is V_{IH}.

6. Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.

7. Following the third bus cycle, inputs the program sequential address and write data of "N" times. Finally, input the any valid address within the target block to be programmed and the confirm command (D0H). Refer to Appendix for details.

8. If the program operation in one partition is suspended and the erase operation in other partition is also suspended, the suspended program operation should be resumed first, and then the suspended erase operation should be resumed next.

9. Full chip erase and OTP program operations can not be suspended. The OTP Program command can not be accepted while the block erase operation is being suspended.

10. Following the Clear Block Lock Bit command, block which is not locked-down is unlocked when #WP is V_{IL}. When #WP is V_{IH}, lock-down bit is disabled and the selected block is unlocked regardless of lock-down configuration.

11. Commands other than those shown above are reserved by Winbond for future device implementations and should not be used.

Table 7. Functions of Block Lock(5) and Block Lock-Down

CURRENT STATE					ERASE/PROGRAM ALLOWED(2)
State	#WP	DQ1(1)	DQ0(1)	State Name	
[000]	0	0	0	Unlocked	Yes
[001](3)	0	0	1	Locked	No
[011]	0	1	1	Locked-down	No
[100]	1	0	0	Unlocked	Yes
[101](3)	1	0	1	Locked	No
[110](4)	1	1	0	Lock-down Disable	Yes
[111]	1	1	1	Lock-down Disable	No

Notes:

1. DQ0 = 1: a block is locked; DQ0 = 0: a block is unlocked.
   DQ1 = 1: a block is locked-down; DQ1 = 0: a block is not locked-down.

2. Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.

3. At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [001] (#WP = 0) or [101] (#WP = 1), regardless of the states before power-off or reset operation.

4. When #WP is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.

5. OTP (One Time Program) block has the lock function, which is different from those described above.

Table 8. Block Locking State Transitions upon Command Write(4)

Winbond
Electronics Corp.

Notes:

1. "Set Lock" means Set Block Lock Bit command, "Clear Lock" means Clear Block Lock Bit command and "Set Lock-down" means Set Block Lock-Down Bit command.

2. When the Set Block Lock-Down Bit command is written to the unlocked block (DQ0 = 0), the corresponding block is locked-down and automatically locked at the same time.

3. "No Change" means that the state remains unchanged after the command written.

4. In this state transitions table, assumes that #WP is not changed and fixed V_{IL} or V_{IH}.

Table 9. Block Locking State Transitions upon #WP Transition[4]

PREVIOUS STATE	CURRENT STATE				RESULT AFTER #WP TRANSITION (NEXT STATE)	
	State	#WP	DQ1	DQ0	#WP = 0→1[1]	#WP = 1→0[1]
-	[000]	0	0	0	[100]	-
-	[001]	0	0	1	[101]	-
[110][2]	[011]	0	1	1	[110]	-
Other than [110][2]					[111]	-
-	[100]	1	0	0	-	[000]
-	[101]	1	0	1	-	[001]
-	[110]	1	1	0	-	[011][3]
-	[111]	1	1	1	-	[011]

Notes:

1. "#WP = 0→1" means that #WP is driven to V_{IH} and "#WP = 1→0" means that #WP is driven to V_{IL}.

2. State transition from the current state [011] to the next state depends on the previous state.

3. When #WP is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.

4. In this state transitions table, assumes that lock configuration commands are not written in previous, current and next state.

	Status Register indicates the status of the partition, not WSM (Write State Machine). Even if the SR.7 is "1", the WSM may be occupied by the other partition when the device is set to 2, 3 or 4 partitions configuration.
	
	Check SR.7 to determine block erase, full chip erase, (page buffer) program or OTP program completion. SR.6 − SR.1 are invalid while SR.7 = "0".
	
	If both SR.5 and SR.4 are "1"s after a block erase, full chip erase, page buffer program, set/clear block lock bit, set block lock-down bit, set partition configuration register attempt, an improper command sequence was entered.
	
	SR.3 does not provide a continuous indication of V_{PP} level. The WSM interrogates and indicates the V_{PP} level only after Block Erase, Full Chip Erase, (Page Buffer) Program or OTP Program command sequences. SR.3 is not guaranteed to report accurate feedback when $V_{PP} \neq V_{PPH1}$, V_{PPH2} or V_{PPLK}.
	
	SR.1 does not provide a continuous indication of block lock bit. The WSM interrogates the block lock bit only after Block Erase, Full Chip Erase, (Page Buffer) Program or OTP Program command sequences. It informs the system, depending on the attempted operation, if the block lock bit is set. Reading the block lock configuration codes after writing the Read Identifier Codes/OTP command indicates block lock bit status.
	
	SR.15 − SR.8 and SR.0 are reserved for future use and should be masked out when polling the status register.

V_{PP} Supply Voltage.. .... -0.2V to +12.6V[2,3,4]

Output Short Circuit Current... ....100 mA[5]

WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.

Notes:

1. Operating temperature is for extended temperature product defined by this specification.

2. All specified voltages are with respect to V_{SS}. Minimum DC voltage is -0.5V on input/output pins and -0.2V on V_{DD} and V_{PP} pins. During transitions, this level may undershoot to -2.0V for periods <20 nS. Maximum DC voltage on input/output pins is V_{DD} +0.5V, which, during transitions, may overshoot to V_{DD} +2.0V for periods <20 nS.

3. Maximum DC voltage on V_{PP} may overshoot to +13.0V for periods <20 nS.

4. V_{PP} erase/program voltage is normally 2.7V to 3.6V. Applying 11.7V to 12.3V to V_{PP} during erase/program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks. V_{PP} may be connected to 11.7V to 12.3V for a total of 80 hours maximum.

5. Output shorted for no more than one second. No more than one output shorted at a time.

Maximum V_{PP} hours at V_{PPH2}				80	Hours	

Notes:

1. See DC Characteristics tables for voltage range-specific specification.

2. Applying V_{PP} = 11.7V to 12.3V during a erase or program can be done for a maximum of 1,000 cycles on the main blocks and 1,000 cycles on the parameter blocks. A permanent connection to V_{PP} = 11.7V to 12.3V is not allowed and can cause damage to the device.

AC Input/Output Test Conditions

AC test inputs are driven at V_{DDQ}(min) for a Logic "1" and 0.0V for a Logic "0".
Input timing begins, and output timing ends at V_{DDQ}/2. Input rise and fall times (10% to 90%) < 5 nS.
Worst case speed conditions are when V_{DD} = V_{DD}(min).

Notes:

1. All currents are in RMS unless otherwise noted. Typical values are the reference values at V_{DD} = 3.0V and T_A = +25° C unless V_{DD} is specified.

2. I_{CCWS} and I_{CCES} are specified with the device de-selected. If read or (page buffer) program is executed while in block erase suspend mode, the device's current draw is the sum of I_{CCES} and I_{CCR} or I_{CCW}. If read is executed while in (page buffer) program suspend mode, the device's current draw is the sum of I_{CCWS} and I_{CCR}.

3. Block erases, full chip erase, (page buffer) program and OTP program are inhibited when $V_{PP} \leq V_{PPLK}$, and not guaranteed in the range between V_{PPLK} (max.) and V_{PPH1} (min.), between V_{PPH1} (max.) and V_{PPH2} (min.) and above V_{PPH2} (max.).

4. The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings (t_{AVQV}) provide new data when address are changed.

5. Sampled, not 100% tested.

6. V_{PP} is not used for power supply pin. With $V_{PP} \leq V_{PPLK}$, block erase, full chip erase, (page buffer) program and OTP program cannot be executed and should not be attempted.
   Applying 12V ±0.3V to V V_{PP} provides fast erasing or fast programming mode. In this mode, V_{PP} is power supply pin and supplies the memory cell current for block erasing and (page buffer) programming. Use similar power supply trace widths and layout considerations given to the V_{DD} power bus.
   Applying 12V ±0.3V to V_{PP} during erase/program can only be done for a maximum of 1,000 cycles on each block. V_{PP} may be connected to 12V ±0.3V for a total of 80 hours maximum.

7. The operating current in dual work is the sum of the operating current (read, erase, program) in each plane.

Notes:

1. See AC Input/Output Reference Waveform for timing measurements and maximum allowable input slew rate.

2. Sampled, not 100% tested.

3. #OE may be delayed up to t_{ELQV} to t_{GLQV} after the falling edge of #CE without impact to t_{ELQV}.

4. Address setup time (t_{AVEL} to t_{AVGL}) is defined from the falling edge of #CE or #OE (whichever goes low last).

5. Address hold time (t_{ELAX} to t_{GLAX}) is defined from the falling edge of #CE or #OE (whichever goes low last).

6. Specifications t_{AVEL}, t_{AVGL}, t_{ELAX}, t_{GLAX}, and t_{EHEL}, t_{GHGL} for read operations apply to only status register read operations.

#WE(#CE) High to SR.7 Going "0" (note 3,7)	$t_{WHR0}(t_{EHR0})$		t_{AVQV}+50	nS

Notes:

1. The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program and OTP program operations are the same as during read-only operations. Refer to AC Characteristics for read-only operations.

2. A write operation can be initiated and terminated with either #CE or #WE.

3. Sampled, not 100% tested.

4. Write pulse width (t_{WP}) is defined from the falling edge of #CE or #WE (whichever goes low last) to the rising edge of #CE or #WE (whichever goes high first). Hence, t_{WP} = t_{WLWH} = t_{ELEH} = t_{WLEH} = t_{ELWH}.

5. Write pulse width high (t_{WPH}) is defined from the rising edge of #CE or #WE (whichever goes high first) to the falling edge of #CE or #WE (whichever goes low last). Hence, t_{WPH} = t_{WHWL} = t_{EHEL} = t_{WHEL} = t_{EHWL}.

6. V_{PP} should be held at V_{PP} = $V_{PPH1/2}$ until determination of block erase, (page buffer) program or OTP program success (SR.1/3/4/5 = 0) and held at V_{PP} = V_{PPH1} until determination of full chip erase success (SR.1/3/5 = 0).

7. t_{WHR0} (t_{EHR0}) after the Read Query or Read Identifier Codes/OTP command = t_{AVQV}+100 nS.

8. Refer to Table 6 for valid address and data for block erase, full chip erase, (page buffer) program, OTP program or lock bit configuration.

Notes:

1. V_{DD} power-up and standby.
2. Write each first cycle command.
3. Write each second cycle command or valid address and data.
4. Automated erase or program delay.
5. Read status register data.
6. For read operation, #OE and #CE must be driven active, and #WE de-asserted.
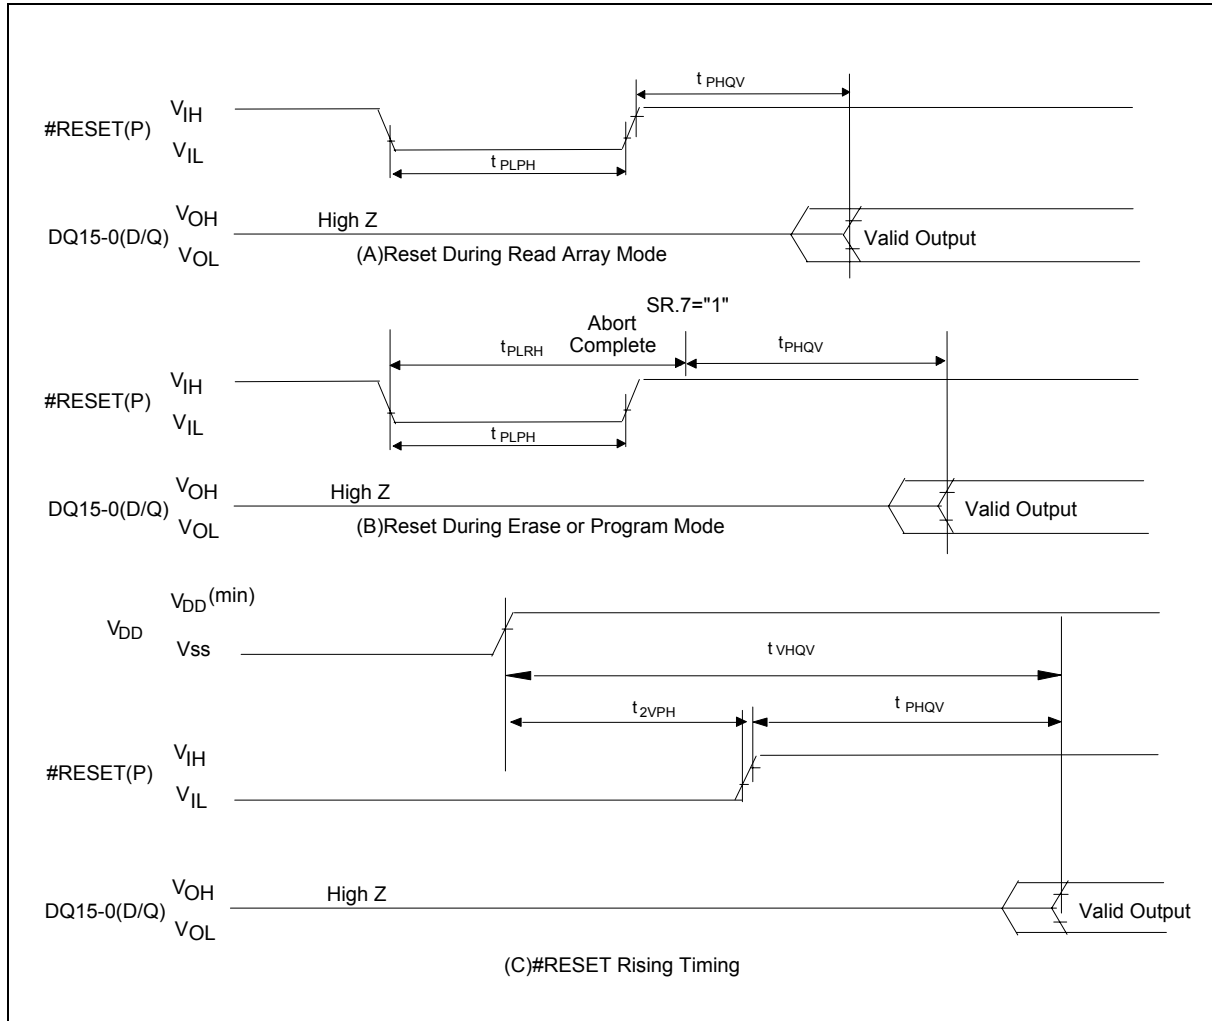

Reset Operations

Figure 10. AC Waveform for Reset Operation

Reset AC Specifications

V_{DD} = 2.7V to 3.6V, T_A = -40°C to +85°C

PARAMETER	SYM.	MIN.	MAX.	UNIT
#RESET Low to Reset during Read (#RESET should be low during power-up.) (note 1, 2, 3)	t_{PLPH}	100		nS
#RESET Low to Reset during Erase or Program (note 1, 3, 4)	t_{PLRH}		22	μS
V_{DD} 2.7V to #RESET High (note 1, 3, 5)	t_{2VPH}	100		nS
V_{DD} 2.7V to Output Delay (note 3)	t_{VHQV}		1	mS

Notes:

1. A reset time, t_{PHQV}, is required from the later of SR.7 going "1" or #RESET going high until outputs are valid. Refer to AC Characteristics - Read-Only Operations for t_{PHQV}.

2. t_{PLPH} is <100 nS the device may still reset but this is not guaranteed.

3. Sampled, not 100% tested.

4. If #RESET asserted while a block erase, full chip erase, (page buffer) program or OTP program operation is not executing, the reset will complete within 100 nS.

5. When the device power-up, holding #RESET low minimum 100ns is required after V_{DD} has been in predefined range and also has been in stable there.

Notes:

1. Typical values measured at V_{DD} = 3.0V, V_{PP} = 3.0V or 12V, and T_A = +25°C. Assumes corresponding lock bits are not set. Subject to change based on device characterization.

2. Excludes external system-level overhead.

3. Sampled, but not 100% tested.

4. A latency time is required from writing suspend command (#WE or #CE going high) until SR.7 going "1".

5. If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t_{ERES} and its sequence is repeated, the block erase operation may not be finished.

5. ADDITIONAL INFORMATION

Recommended Operating Conditions

At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

*1 To prevent the unwanted writes, system designers should consider the design, which applies V_{PP} to 0V during read operations and $V_{PPH1/2}$ during write or erase operations.

Figure A-1. AC Timing at Device Power-up

For the AC specifications t_{VR}, t_R, t_F in the figure, refer to the next page. See the "ELECTRICAL SPECIFICATIONS" described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.
