## Functional Description

The CY7C09079V/89V/99V and CY7C09179V/89V/99V are high-speed synchronous CMOS 32K, 64K, and $128 \mathrm{~K} \times 8 / 9$ dual-port static RAMs. Two ports are provided, permitting independent, simultaneous access for reads and writes to any location in memory. ${ }^{[4]}$ Registers on control, address, and data lines allow for minimal set-up and hold times. In pipelined output mode, data is registered for decreased cycle time. Clock to data valid $\mathrm{t}_{\mathrm{CD} 2}=6.5 \mathrm{~ns}^{[1]}$ (pipelined). Flow-through mode can also be used to bypass the pipelined output register to eliminate access latency. In flow-through mode data will be available $\mathrm{t}_{\mathrm{CD} 1}=18 \mathrm{~ns}$ after the address is clocked into the device. Pipelined output or flow-through mode is selected via the FT/Pipe pin.
Each port contains a burst counter on the input address register. The internal write pulse width is independent of the LOW-to-HIGH transition of the clock signal. The internal write pulse is self-timed to allow the shortest possible cycle times.

A HIGH on $\overline{\mathrm{CE}}_{0}$ or LOW on $\mathrm{CE}_{1}$ for one clock cycle will power down the internal circuitry to reduce the static power consumption. The use of multiple Chip Enables allows easier banking of multiple chips for depth expansion configurations. In the pipelined mode, one cycle is required with $\mathrm{CE}_{0} \mathrm{LOW}$ and $\mathrm{CE}_{1}$ HIGH to reactivate the outputs.
Counter enable inputs are provided to stall the operation of the address input and utilize the internal address generated by the internal counter for fast interleaved memory applications. A port's burst counter is loaded with the port's Address Strobe (ADS). When the port's Count Enable (CNTEN) is asserted, the address counter will increment on each LOW-to-HIGH transition of that port's clock signal. This will read/write one word from/into each successive address location until CNTEN is deasserted. The counter can address the entire memory array and will loop back to the start. Counter Reset (CNTRST) is used to reset the burst counter.
All parts are available in 100-pin Thin Quad Plastic Flatpack (TQFP) packages.

| :---: | :---: | :---: |
| $\mathrm{A}_{0 L}-\mathrm{A}_{16 \mathrm{~L}}$ | $\mathrm{A}_{0 \mathrm{R}}-\mathrm{A}_{16 \mathrm{R}}$ | Address Inputs ( $\mathrm{A}_{0}-\mathrm{A}_{14}$ for $32 \mathrm{~K} ; \mathrm{A}_{0}-\mathrm{A}_{15}$ for 64 K ; and $\mathrm{A}_{0}-\mathrm{A}_{16}$ for 128 K devices). |
| $\mathrm{ADS}_{\mathrm{L}}$ | $\mathrm{ADS}_{\mathrm{R}}$ | Address Strobe Input. Used as an address qualifier. This signal should be asserted LOW to access the part using an externally supplied address. Asserting this signal LOW also loads the burst counter with the address present on the address pins. |
| $\overline{\mathrm{CE}}_{0 \mathrm{~L}}, \mathrm{CE}_{1 \mathrm{~L}}$ | $\overline{\mathrm{CE}}_{0 \mathrm{R}}, \mathrm{CE}_{1 \mathrm{R}}$ | Chip Enable Input. To select either the left or right port, both $\overline{C E}_{0}$ AND $C E_{1}$ must be asserted to their active states ( $\overline{\mathrm{CE}}_{0} \leq \mathrm{V}_{\mathrm{IL}}$ and $\left.\mathrm{CE}_{1} \geq \mathrm{V}_{\mathrm{IH}}\right)$. |
| CLK ${ }_{\text {L }}$ | $\mathrm{CLK}_{\mathrm{R}}$ | Clock Signal. This input can be free running or strobed. Maximum clock input rate is $\mathrm{f}_{\text {MAX }}$ - |
| $\mathrm{CNTEN}_{\mathrm{L}}$ | $\mathrm{CNTEN}_{\mathrm{R}}$ | Counter Enable Input. Asserting this signal LOW increments the burst address counter of its respective port on each rising edge of CLK. $\overline{\text { CNTEN }}$ is disabled if $\overline{\text { ADS }}$ or $\overline{\text { CNTRST }}$ are asserted LOW. |
| $\mathrm{CNTRST}_{\mathrm{L}}$ | $\mathrm{CNTRST}_{\mathrm{R}}$ | Counter Reset Input. Asserting this signal LOW resets the burst address counter of its respective port to zero. CNTRST is not disabled by asserting ADS or CNTEN. |

17. The output is disabled (high-impedance state) by $\overline{\mathrm{CE}}_{0}=\mathrm{V}_{\mathrm{IH}}$ or $\mathrm{CE}_{1}=\mathrm{V}_{\mathrm{IL}}$ following the next rising edge of the clock.
18. Addresses do not have to be accessed sequentially since $\mathrm{ADS}=\mathrm{V}_{\mathrm{IL}}$ constantly loads the address on the rising edge of the CLK. Numbers are for reference only.
