LAW005-Series Power Modules: 36 Vdc to 75 Vdc Inputs; 5 W

The LAW005-Series Power Modules use advanced, surface-mount technology and deliver high-quality, compact, dc-dc conversion at an economical price.

Options

- Short pin 2.8 mm ± 0.25 mm (0.110 in. ± 0.010 in.)

Description

The LAW005-Series Power Modules are low-profile dc-dc converters that operate over an input voltage range of 36 Vdc to 75 Vdc and provide precisely regulated single and dual outputs. The -25 °C to +71 °C operating temperature range makes it ideal for electronic data processing applications. The outputs are isolated from the inputs, allowing versatile polarity configurations and grounding connections. The modules have a maximum power rating of 5 W and a typical full-load efficiency of 80%.

Built-in filtering for both input and output minimizes the need for external filtering.

Features

- Small footprint: 32 mm x 20 mm (1.25 in. x 0.8 in.)
- Low profile: 10 mm (0.40 in.)
- Wide input voltage range: 36 Vdc to 75 Vdc
- Output current limiting, unlimited duration
- Short-circuit shutdown
- Output overvoltage clamp
- Input-to-output isolation 1500 Vdc
- Operating ambient temperature range: -25 °C to +71 °C with no derating
- 12.5 W per cubic inch
- Within FCC and VDE Class A radiated limits
- UL* Recognition, CSA† Certification, and VDE License approvals pending
- CE mark pending for 73/23/EEC and 93/68/EEC directives‡
- Metal case
- Burn in 4 hours @ 50 °C, full load

* UL is a registered trademark of Underwriters Laboratories, Inc.

† CSA is a registered trademark of Canadian Standards Association.

‡ This product is intended for integration into end-use equipment. All the required procedures for CE marking of end-use equipment should be followed. (The CE mark is placed on selected products.)

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage: Continuous Transient (100 ms)	V _I V _I , trans	0 0	80 100	Vdc V
Operating Ambient Temperature* (natural convection)	T _A	-25	71	°C
Storage Temperature	T _{stg}	-55	105	°C
I/O Isolation Voltage	—	—	1500	Vdc
Operating Case Temperature	T _c	—	105	°C

* At full load, derate linearly to 0 W at 100 °C. Unit guaranteed to start at -40 °C. All parameters will be within specification at T_{case} = -25 °C.

Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage and resistive load from -25 °C to +71 °C.

Table 1. Input Specifications

Parameter	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	V _I	36	48	75	Vdc
Maximum Input Current (V _I = 0 V to V _I , max; I _O = I _O , max)	I _I , max	—	250	—	mA
Inrush Transient	I ² t	—	0.008	—	A ² s
Input Reflected-ripple Current	I _{IR}	—	5	—	mA _{p-p}

Fusing Considerations

CAUTION: This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow, dc fuse with a maximum rating of 5 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

Weight	—	18 (0.64)	20 (0.71)	g (oz.)

Test Configurations

Note: Input reflected-ripple current is measured with a simulated source impedance of 12 μ H. Capacitor C_s offsets possible battery impedance. Current is measured at the input of the module.

Figure 1. Input Reflected-Ripple Test Setup

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \left(\frac{[V_o(+)-V_o(-)]I_o}{[V_i(+)-V_i(-)]I_i} \right) \times 100$$

Figure 3. Output Voltage and Efficiency Measurement Test Setup

Safety Considerations

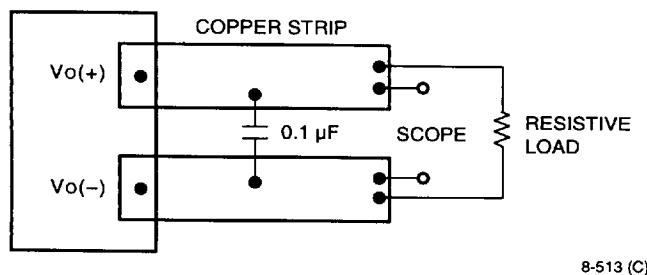

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., UL-1950, CSA 22.2-950, and EN60950.

For the converter output to be considered meeting the requirements of safety extra-low voltage (SELV), one of the following must be true:

- All inputs are SELV and floating, with the output also floating.
- All inputs are SELV and grounded, with the output also grounded.
- Any non-SELV input must be provided with reinforced insulation from any other hazardous voltages, including the ac mains, and must have a SELV reliability test performed on it in combination with the converters. Inputs must meet SELV requirements.

If the input meets extra-low voltage (ELV) requirements, then the converter's output is considered ELV.

The input to these units is to be provided with a maximum 5 A normal-blow fuse in the ungrounded lead.

Note: Use a 0.1 μ F ceramic capacitor. Scope measurement should be made using a BNC socket. Position the load between 50.8 mm and 76.2 mm (2 in. and 3 in.) from the module.
