

1.5 AMP NEGATIVE VOLTAGE REGULATORS

LAS 1800

FEATURES

- Guaranteed input-output differential:
- 2.1 Volts
- Low noise, band gap reference
- Remote sense capability
- Sample power cycled burn-in
- Guaranteed thermal resistance junction to case: 3°C/W

DESCRIPTION

The LAS 1800 Series voltage regulators are monolithic integrated circuits designed for use in applications requiring a well regulated negative output voltage. Outstanding features include full power usage up to 1.5 amperes of load current, internal current limiting, thermal shutdown, and safe area protection on the chip, providing protection of the series pass Darlington, under most operating conditions. Hermetically sealed steel TO-3 packages are utilized for high reliability and low thermal resistance.

A low-noise, temperature stable band gap reference is the key design factor insuring excellent temperature regulation of the LAS 1800 Series. This coupled to a very low output impedance insures superior performance and load regulation.

The LAS 18U, a four-terminal adjustable regulator, is available with an output range from -2.6 to -30 Volts, adjustable with a single potentiometer.

ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	MINIMUM	MAXIMUM	UNITS
Input Voltage	V_{IN}		-35 (-40) ⁽¹⁾ (2)	Volts
Power Dissipation	P_D		Internally Limited ⁽³⁾	Watts
Thermal Resistance Junction to Case	θ_{JC}		3	°C/Watt
Operating Junction Temperature Range	T_J	-55	150	°C
Storage Temperature Range	T_{STG}	-65	150	°C
Lead Temperature (Soldering, 60 Seconds Time Limit)	T_{LEAD}		300	°C

⁽¹⁾ Short circuit is only assured to V_{IN} max. Value of -35V applies to V_O of -5V to -12V. Value of -40V applies to V_O of -15V to -24V and LAS 18U.

⁽²⁾ In case of short circuit with input-output voltages approaching V_{IN} max, regulator may require the removal of the input voltage to restart.

⁽³⁾ For operation above 105°C T_{CASE} , derate @ 333 mW/°C.

ELECTRICAL CHARACTERISTICS

Input voltage test conditions are as follows: $V_1 = V_0 - 5$ Volts, $V_2 = V_0 - 10$ Volts, $V_3 = V_0 - 15$ Volts, or the maximum input, whichever is less.

(1) Nominal output voltages are specified under Device Selection Guide.

(2) Low duty cycle pulse testing with Kelvin connections required. Die temperature changes must be accounted for separately.

(3) BW = 10Hz - 100KHz

(4) Ripple attenuation is specified for a 1Vrms, 120Hz, input ripple.

Ripple attenuation is minimum of 54 dB at 5V output and is 1 dB less for each volt increase in the output voltage.

(5) $V_o = V_c (1 + R1/R2)$

R1 = Resistance from output to control

R2 = Resistance from control to common

(6) For V_o of -2V, the minimum input-output differential is -5.1V.
