DOUBLE CHANNEL HIGH SIDE SOLID STATE RELAY

TYPE	$R_{DS(on)}$	I_{OUT}	V_{CC}
VND830ASP	60 m Ω (*)	6 A (*)	36 V (*)

(*) Per channel

- DC SHORT CIRCUIT CURRENT: 6A
- CMOS COMPATIBLE INPUTS
- PROPORTIONAL LOAD CURRENT SENSE
- UNDERVOLTAGE AND OVERVOLTAGE SHUT-DOWN
- OVERVOLTAGE CLAMP
- THERMAL SHUT-DOWN
- CURRENT LIMITATION
- VERY LOW STAND-BY POWER DISSIPATION
- PROTECTION AGAINST:
 - LOSS OF GROUND AND LOSS OF V_{CC}
- REVERSE BATTERY PROTECTION (**)

DESCRIPTION

The VND830ASP is a monolithic device made using STMicroelectronics VIPower M0-3 technology. It is intended for driving any kind of load with one

PowerSO-10™

ORDER CODES

PACKAGE	TUBE	T&R
PowerSO-10™	VND830ASP	VND830ASP13TR

side connected to ground. Active V_{CC} pin voltage clamp protects the device against low energy spikes (see ISO7637 transient compatibility table). This device has two channels in high side configuration; each channel has an analog sense output on which the sensing current is proportional (according to a known ratio) to the corresponding load current. Built-in thermal shut-down and outputs current limitation protect the chip from over temperature and short circuit. Device turns off in case of ground pin disconnection.

APPLICATION SCHEMATIC

GND PROTECTION NETWORK AGAINST REVERSE BATTERY

Solution 1: Resistor in the ground line (R_{GND} only). This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

- 1) $R_{GND} \leq 600\text{mV} / I_{S(on)max}$
- 2) $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power Dissipation in R_{GND} (when $V_{CC} < 0$: during reverse battery situations) is:

$$P_D = (-V_{CC})^2 / R_{GND}$$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where $I_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the R_{GND} will produce a shift ($I_{S(on)max} * R_{GND}$) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same R_{GND} .

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see below).

Solution 2: A diode (D_{GND}) in the ground line.

A resistor ($R_{GND} = 1\text{k}\Omega$) should be inserted in parallel to D_{GND} if the device will be driving an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network will produce a shift ($\approx 600\text{mV}$) in the input thresholds and the status output values if the microprocessor ground is not common with the device ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

LOAD DUMP PROTECTION

D_{id} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds V_{CC} max DC rating. The same applies if the device will be subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

 μC I/Os PROTECTION:

If a ground protection network is used and negative transient are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the μC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of μC and the current required by the

HSD I/Os (Input levels compatibility) with the latch-up limit of μC I/Os.

$$-V_{\text{CCpeak}}/I_{\text{latchup}} \leq R_{\text{prot}} \leq (V_{\text{OH}\mu\text{C}} - V_{\text{IH}} - V_{\text{GND}}) / I_{\text{IHmax}}$$

Calculation example:

For $V_{\text{CCpeak}} = -100\text{V}$ and $I_{\text{latchup}} \geq 20\text{mA}$; $V_{\text{OH}\mu\text{C}} \geq 4.5\text{V}$
 $5\text{k}\Omega \leq R_{\text{prot}} \leq 65\text{k}\Omega$.

Recommended R_{prot} value is $10\text{k}\Omega$.
