

STEPPER MOTOR DRIVER

- MICROSTEPPING
- BIPOLAR OUTPUT CURRENT UP TO 400 mA
- LOW SATURATION VOLTAGE
- BUILT-IN FAST RECOVERY DIODES
- OUTPUT CURRENT DIGITALLY PROGRAMMABLE
- 6 BIT D/A CONVERTERS SET OUTPUT CURRENT
- THERMAL SHUTDOWN

DESCRIPTION

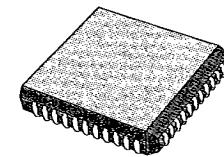

The L6217 is a monolithic IC that controls and drives both phases of a Bipolar Stepper Motor with PWM control of the phase current. The output current level of each phase is programmed by a 6 bit D/A converter so that the device may be used in full-step, half-step and micro-step applications. The inputs for the D/A converters and the phase inputs to select the direction of current flow are latched to minimize the interface to a microprocessor.

The power section of the device is a dual H-Bridge drive with internal clamp diodes for current recirculation. To maintain the degree of accuracy required

for micro-stepping the motor current is internally sensed and compared to the output of the D/A converter.

A monostable, programmed by an RC network sets the motor current decay time.

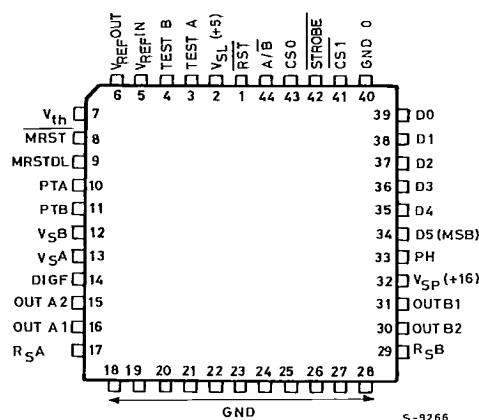

The L6217 is supplied in a 44 pin PLCC with 11 of the 44 pins used for heatsinking.

PIN FUNCTION DESCRIPTION

N°	Name	Function
1	R _{st}	Active low input resets the D/A latches to 0 and disables the output.
38,39	D0 - D5	Data inputs for the D/A converter (D0 = LSB). For a data input of 00, the corresponding outputs are held in the off state.
44	A/B	Channel select for input data. Pin A/B selects channel A when high.
33	PH	Logic input selects direction of current flow in output bridge from A1 (B1) to A2 (B2) for PH = 1.
42	Strobe	Active low input latches input data (D0-D5 and PH) into input latch.
9	MRST DL	The capacitor on this pin programs the power on reset delay according to the formula : $T_{DR} = (0.35) (C) 10^6$
8	MRST	Power-on reset circuit output. (micro reset signal). This output remains low from power on until the delay capacitor has charged past the delay threshold.
10	P _{tA}	Pulse time A, an external parallel RC network tied to ground defines T _{off} time for channel A. (T _{off} = 0.69 R2C2).
11	P _{tB}	Pulse time B, an external parallel RC network tied to ground defines toll time for channel B. (T _{off} = 0.69 R3C3).
5	V _{ref in}	Voltage applied to this point sets the reference for the D/A converter and therefore sets the maximum output current. (see equation 1, next two pages).
18 to 28	Gnd	Ground connection and also conducts heat to the P.C. board.
40	Gnd 0	Pin must be connected to ground.
2	V _{sl}	Logic Supply Voltage
32	V _{sp}	Motor Supply Voltage
16,15 31,30	Out A1 - A2 B1 - B2	H - Bridge outputs.
43,41	CS0, CS1	Chip select inputs CS0 is active high, CS1 is active low.
17,29	R _{sA} - R _{sB}	Sense resistor from this pin to ground set the peak output current.
13,12	V _{sA} - V _{sB}	Analog inputs for sensing motor current, separate inputs are provided to allow filtering of the sense voltage if required.
3,4	Test A & B	These pins are for testing of D/A outputs.
6	V _{ref out}	2.5 V band gap reference.
7	V _{th}	Reset Threshold Voltage
14	DIGF	Can be used to modify the internal comparator lockout time. In microstepping typical application a 1.8 KΩ resistor must be connected between this pin and ground.

CIRCUIT OPERATION

The current control section of the L6217A is a pulse width modulated control that senses the motor current. When the motor current reaches the peak programmed current the comparator will trigger the monostable turning off the upper transistors. After the t_{off} time equal to 0.69 RC the upper drivers are enabled again.

The peak current is given by the equation :

$$I_{op} = \frac{V_{ref}}{4.69 \cdot R_{sense}} \cdot \frac{D}{64}$$

D = Input data (0 - 63)

When the input data is 00, the output stages are disabled by internal logic so that the output current decays rapidly to zero.

An internal generated lockout time avoids the use of an external RC network between the sensing resistor (R_{sA}, R_{sB}) and the corresponding input (V_{sA}, V_{sB}), by disabling the comparator sensing during the lockout time. This time is typically 2.5μs.
