

HIGH VOLTAGE INTERFACE

- TELEPHONE LINE FEEDING WITH DIRECT OR REVERSAL POLARITY
- EXTRA FEEDING FOR LONG TELEPHONE LINE
- LINE SENSING ON BOTH WIRES
- BALANCED RINGING SIGNAL INJECTION
- HIGH OUTPUT CURRENT CAPABILITY
- THERMAL OVERLOAD PROTECTION

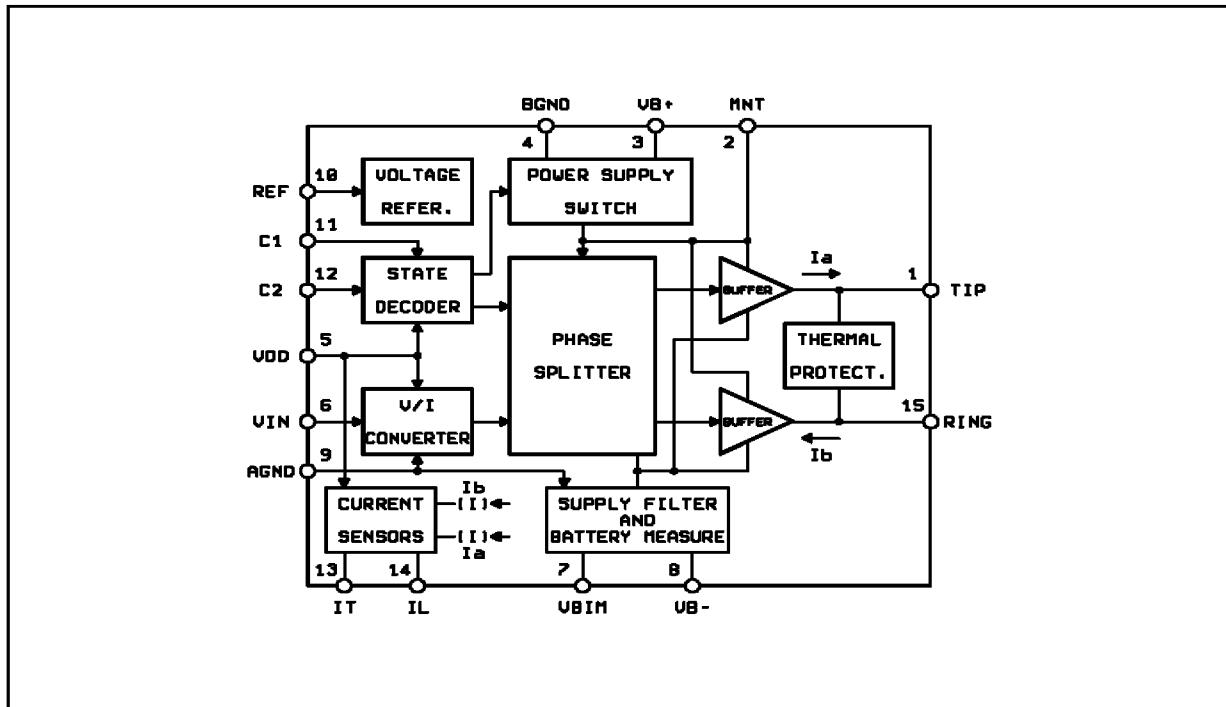

DESCRIPTION

The L3000S line interface provides a battery feeding for telephone lines and ringing injection. It contains a state decoder that under external control forces three operational modes (with their options): standby, conversation and ringing. Two pins give information about the line status detected by sensing the line current into the output stage. The IC amplifies the signal entering at pin 6(VIN). Separate ground pins are also provided for

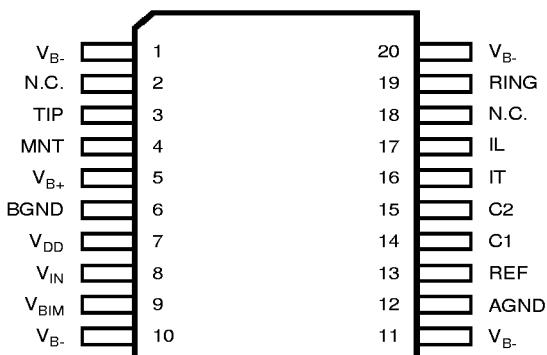

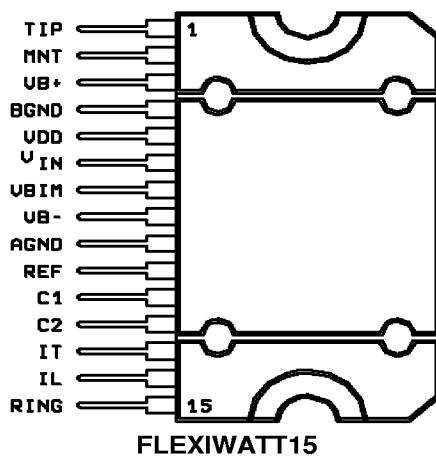

the output stages that are referred to battery ground, and for analog signal processing circuits that are referred to analog ground. The L3000S needs only two external components; a resistor to provide internal bias current and a capacitor to filter battery AC components.

PIN DESCRIPTION

FLEX. N°	SO-P. N°	Name	Description
1	3	TIP	A line termination output with current capability up to 100mA (I_s is the current sourced from this pin).
2	4	MNT	Positive Supply Voltage Monitor.
3	5	V_{B+}	Positive Battery Supply Voltage.
4	6	BGND	Battery ground relative to the V_{B+} and the V_{B-} supply voltages. It is also the reference ground for TIP and RING signals.
5	7	V_{DD}	Positive Power Supply +5V.
6	8	V_{IN}	2 wire unbalanced voltage input.
7	9	VBIM	Output voltage without current capability, with the following functions: - give an image of the total battery voltage scaled by 40 to the low voltage part. - filter by an external capacitor the noise on V_{B+} and the V_{B-} .
8	1,10,11, 20	V_{B-}	Negative Battery Supply Voltage.
9	12	AGND	Analog Ground. All input signals and the V_{DD} supply voltage must be referred to this pin.
10	13	REF	Voltage reference output with very low temperature coefficient. The connected resistor sets Internal circuit bias current.
11	14	C1 (NB/BB/RG)	Digital signal input (3 levels) that defines device status with pin 12. In thermal overload condition a 240µA typ. current is sunk by this pin (*).
12	15	C2 (PD/DP/RP)	Digital signal input (3 levels) that defines device status with pin 11. (*)
13	16	I_T	High precision scaled transversal line current signal. $I_T = \frac{I_a + I_b}{100}$
14	17	I_L	Scaled longitudinal line current signal. $I_L = \frac{I_a - I_b}{100}$
15	19	RING	B line termination output with current capability up to 100mA (I_b is the current sunk into this pin).

- 1) Recommended sequence for power on during automatic testing is: **1) GND; 2) VB₋; 3) VDD; 4) VB₊.**
During power off the opposite sequence should be used: **1) VB₊; 2) VDD; 3) VB₋; 4) GND.**
- 2) In case power on sequence cannot be guaranteed (i.e. not insertion in real application and so on), a shottky diode should be connected between BGND and VB₋. The shottky diode characteristics should be:
 $V_F < 450\text{mV} @ I_F = n \cdot 15\text{mA}, T_{amb} = 25^\circ\text{C}$
 $V_F < 350\text{mV} @ I_F = n \cdot 15\text{mA}, T_{amb} = 50^\circ\text{C} (T_{jL3000} = 90^\circ\text{C})$
 $V_F < 245\text{mV} @ I_F = n \cdot 15\text{mA}, T_{amb} = 85^\circ\text{C} (T_{jL3000} = 120^\circ\text{C})$
Where n is the number of line sharing the same diode

Note 1: Use a voltmeter in series with $10\text{K}\Omega$ connected to pins 10 and 9.

Note 2: With high impedance voltmeter ($>100\text{K}\Omega$).

Note 3: 0V max means inversion of pin1 and 15.

Note 4: $|V_{BIM}| = (|V_{Btot}| - 2.8\text{V} - 2 \cdot V_{BE}) / 40$. Where: $V_{Btot} = |V_{B-}|$ for pin11 to +5V; pin 12 to GND or -5V $V_{Btot} = |V_{B+}| + |V_{B-}|$ for pin 11 to 0V; Pin 12 to GND or -5V. $2 \cdot V_{BE} = 1.5\text{V}$ @ $T_{amb} = 25^{\circ}\text{C}$.

Note 5: $V_{Idc} = |V_{B+}| - |V_{in}| \cdot 40 - 2.8$.

Note 11: Due to the analog structure of the thermal sensor connected to pin 11 the input bias current at this pin is not a stepfunction but depends on junction temperature (compare with I_{thv} parameter at page 5).
