BLOCK DIAGRAM

512Kx8 BIT CMOS EEPROM MODULE FEATURES

- Read Access Times of 150, 200, 250, 300nS
- JEDEC Standard 32 Pin, Hermetic Ceramic DIP (Package 300)
- Commercial, Industrial and Military Temperature Ranges
- MIL-STD-883 Compliant Devices Available
- Write Endurance 10,000 Cycles
- Data Retention at 25°C, 10 Years
- Low Power CMOS Operation:
3mA Standby Typical/100mA Operating Maximum
- Automatic Page Write Operation
Internal Address and Data Latches for
512 Bytes, 1 to 128 Bytes/Row, Four Pages
- Page Write Cycle Time 10mS Max.
- Data Polling for End of Write Detection
- Hardware and Software Data Protection
- TTL Compatible Inputs and Outputs

256Kx8 CMOS EEPROM, WE256K8-XCX, SMD 5962-93155

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol		Unit
Operating Temperature	T _A	-55 to +125	°C
Storage Temperature	T _{STG}	-65 to +150	°C
Signal Voltage Any Pin	V _G	-0.6 to +6.25	V
Voltage on OE and A9		-0.6 to +13.5	V
Thermal Resistance junction to case	θ _{JC}	28	°C/W
Lead Temperature (soldering -10 secs)		+300	°C

NOTE:

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Max	Unit
Supply Voltage	V _{CC}	4.5	5.5	V
Input High Voltage	V _{IH}	2.0	V _{CC} + 0.3	V
Input Low Voltage	V _{IL}	-0.3	+0.8	V
Operating Temp. (Mil.)	T _A	-55	+125	°C
Operating Temp. (Ind.)	T _A	-40	+85	°C

DC CHARACTERISTICS

(V_{CC} = 5.0V, V_{SS} = 0V, T_A = -55°C to +125°C)

Parameter	Symbol	Conditions	512K x 8			256K x 8			128K x 8			Unit

FIG. 4
AC TEST CIRCUIT

AC TEST CONDITIONS

Parameter	Typ	Unit
Input Pulse Levels	V _{IL} = 0, V _{IH} = 3.0	V
Input Rise and Fall	5	nS
Input and Output Reference Level	1.5	V
Output Timing Reference Level	1.5	V

NOTES:

V_Z is programmable from -2V to +7V.
I_{OL} & I_{OH} programmable from 0 to 16mA.
Tester Impedance Z₀ = 75 Ω.
V_Z is typically the midpoint of V_{OH} and V_{OL}.
I_{OL} & I_{OH} are adjusted to simulate a typical resistive load circuit.
ATE tester includes jig capacitance.

**READ**

Figure 5 shows Read cycle waveforms. A read cycle begins with selection address, chip select and output enable. Chip select is accomplished by placing the $\overline{\text{CS}}$ line low. Output enable is done by placing the $\overline{\text{OE}}$ line low. The memory places the selected data byte on I/O₀ through I/O₇ after the access time. The output of the memory is placed in a high impedance state shortly after either the $\overline{\text{OE}}$ line or $\overline{\text{CS}}$ line is returned to a high level.

**FIG. 5
READ WAVEFORMS**

NOTE:
OE may be delayed up to $t_{\text{ACS}} - t_{\text{OE}}$ after the falling edge of $\overline{\text{CS}}$ without impact on t_{OE} or by $t_{\text{ACC}} - t_{\text{OE}}$ after an address change without impact on t_{ACC} .

**AC READ CHARACTERISTICS (SEE FIGURE 5)

Chip Select or Output Enable to High Z Output	t_{DF}		70		70	nS

WRITE

Write operations are initiated when both $\overline{\text{CS}}$ and $\overline{\text{WE}}$ are low and OE is high. The EEPROM devices support both a CS and WE controlled write cycle. The address is latched by the falling edge of either CS or WE, whichever occurs last.

The data is latched internally by the rising edge of either $\overline{\text{CS}}$ or $\overline{\text{WE}}$, whichever occurs first. A byte write operation will automatically continue to completion.

WRITE CYCLE TIMING

Figures 6 and 7 show the write cycle timing relationships. A write cycle begins with address application, write enable and chip select. Chip select is accomplished by placing the CS line low. Write enable consists of setting the WE line low. The write cycle begins when the last of either CS or WE goes low.

The WE line transition from high to low also initiates an internal 150 μ Sec delay timer to permit page mode operation. Each subsequent WE transition from high to low that occurs before the completion of the 150 μ Sec time out will restart the timer from zero. The operation of the timer is the same as a retriggerable one-shot.

AC WRITE CHARACTERISTICS (VCC = 5.0V, VSS = 0V, TA = -55°C to +125°C)

Parameter	Symbol	512K x 8		256K x 8		128K x 8		Unit
		Min	Max	Min	Max	Min	Max

FIG. 7
WRITE WAVEFORMS
CS CONTROLLED

NOTE:

1. Decoded Address Lines must be valid for the duration of the write.

DATA POLLING

Operation with data polling permits a faster method of writing to the EEPROM. The actual time to complete the memory programming cycle is faster than the guaranteed maximum.

The EEPROM features a method to determine when the internal programming cycle is completed. After a write cycle is initiated, the EEPROM will respond to read cycles to provide the microprocessor with the status of the programming cycle. The status consists of the last data byte written being returned with data bit I/O7 complemented during the programming cycle, and I/O7 true after completion.

Data polling allows a simple bit test operation to determine the status of the EEPROM. During the internal programming cycle, a read of the last byte written will produce the complement of the data on I/O7. For example, if the data written consisted of I/O7 = HIGH, then the data read back would consist of I/O7 = LOW.

A polled byte write sequence would consist of the following steps:

1. write byte to EEPROM
2. store last byte and last address written
3. release a time slice to other tasks
4. read byte from EEPROM - last address
5. compare I/O7 to stored value
 - a) If different, write cycle is not completed, go to step 3.
 - b) If same, write cycle is completed, go to step 1 or step 3.

DATA POLLING AC CHARACTERISTICS

(V_{CC} = 5.0V, V_{SS} = 0V, T_A = -55°C to +125°C)

FIG. 8
DATA POLLING
WAVEFORMS

PAGE WRITE OPERATION

These devices have a page write operation that allows one to 64 bytes of data (one to 128 bytes for the WE512K8) to be written into the device and then simultaneously written during the internal programming period. Successive bytes may be loaded in the same manner after the first data byte has been loaded. An internal timer begins a time out operation at each write cycle. If another write cycle is completed within 150 μ s or less, a new time out period begins. Each write cycle restarts the delay period. The write cycles can be continued as long as the interval is less than the time out period.

The usual procedure is to increment the least significant address lines from A₀ through A₅ (A₀ through A₆ for the WE512K8) at each write cycle. In this manner a page of up to 64 bytes (128 bytes for the WE512K8) can be loaded into the EEPROM in a burst mode before beginning the relatively long interval programming cycle.

After the 150 μ s time out is completed, the EEPROM begins an internal write cycle. During this cycle the entire page of bytes will be written at the same time. The internal programming cycle is the same regardless of the number of bytes accessed.

The page address must be the same for each byte load and must be valid during each high to low transition of $\overline{WE}$ (or $\overline{CS}$). The block address also must be the same for each byte load and must remain valid throughout the $\overline{WE}$ (or $\overline{CS}$) low pulse. The page and block address lines are summarized below:

PAGE MODE CHARACTERISTICS

(V_{CC} = 5.0V, V_{SS} = 0V, T_A = -55°C to +125°C)

Parameter	Symbol	Min	Max	Unit
Write Cycle Time, TYP = 6mS	t _{wc}		10	mS
Data Set-up Time	t _{DS}	100		nS
Data Hold Time	t _{DH}	10		nS
Write Pulse Width	t _{WP}	150		nS
Byte Load Cycle Time	t _{BLC}		150	μ S
Write Pulse Width High	t _{WPH}	50		nS

Device	Block Address	Page Address
WE512K8-XCX	A17-A18	A7-A16
WE256K8-XCX	A15-A17	A6-A14
WE128K8-XCX	A15-A16	A6-A14

FIG. 9
PAGE WRITE WAVEFORMS

NOTE:

1. Decoded Address Lines must be valid for the duration of the write.

FIG. 10
SOFTWARE BLOCK DATA
PROTECTION ENABLE ALGORITHM

NOTES:

1. Data Format: I/O₇₋₀ (Hex);
Address Format: A₁₄ - A₀ (Hex).
A₁₇ and A₁₆ control selection of one of four blocks in the 512Kx8.
A₁₅, A₁₄, and A₁₃ control selection of one of 8 pages in the 256Kx8.
A₁₅ and A₁₄ control one of the four blocks in the 128Kx8.
2. Write Protect state will be activated at end of write even if no other data is loaded.
3. Write Protect state will be deactivated at end of write period even if no other data is loaded.
4. 1 to 128 bytes of data at each of 4 blocks may be loaded in the 512Kx8. 1 to 64 bytes of data at each of 8 blocks may be loaded in the 256Kx8 and 1 to 64 bytes on 4 blocks in the 128Kx8.

FIG. 11
SOFTWARE BLOCK DATA
PROTECTION DISABLE ALGORITHM

NOTES:

1. Data Format: I/O 7-0 (Hex);
Address Format: A14-A0 (Hex).
A17 and A18 control selection of one of four blocks in the 512Kx8.
A15, A16, and A17 control selection of one of 8 pages in the 256Kx8.
A15 and A16 control one of the four blocks in the 128Kx8.
2. Write Protect state will be activated at end of write even if no other data is loaded.
3. Write Protect state will be deactivated at end of write period even if no other data is loaded.
4. 1 to 128 bytes of data at each of 4 blocks may be loaded in the 512Kx8. 1 to 64 bytes of data at each of 8 blocks may be loaded in the 256Kx8 and 1 to 64 bytes on 4 blocks in the 128Kx8.

SOFTWARE DATA PROTECTION

A software write protection feature may be enabled or disabled by the user. When shipped by White Microelectronics, the devices have the feature disabled. Write access to the device is unrestricted.

To enable software write protection, the user writes three access code bytes to three special internal locations. Once write protection has been enabled, each write to the EEPROM must use the same three byte write sequence to permit writing. After setting software data protection, any attempt to write to the device without the three-byte command sequence will start the internal write timers. No data will be written to the device, however, for the duration of t_{wc} . The write protection feature can be disabled by a six byte write sequence of specific data to specific locations. Power transitions will not reset the software write protection.

Each 32K byte block (128K bytes for the WE512K8) of EEPROM has independent write protection. One or more blocks may be enabled and the rest disabled in any combination. The software write protection guards against inadvertent writes during power transitions or unauthorized modification using a PROM programmer. The block selection is controlled by the upper most address lines (A17 through A18 for the WE512K8, A15 through A17 for the WE256K8, or A15 and A16 for the WE128K8).

HARDWARE DATA PROTECTION

Several methods of hardware data protection have been implemented in the White Microelectronics EEPROM. These are included to improve reliability during normal operations.

a) Vcc power on delay

As Vcc climbs past 3.8V typical the device will wait 5mSec typical before allowing write cycles.

b) Vcc sense

While below 3.8V typical write cycles are inhibited.

c) Write inhibiting

Holding $\overline{OE}$ low and either $\overline{CS}$ or $\overline{WE}$ high inhibits write cycles.

d) Noise filter

Pulses of <15nS (typ) on $\overline{WE}$ or $\overline{CS}$ will not initiate a write cycle.

The drawing illustrates the mechanical specifications of the 424 package. The top view shows a rectangular package with a width of $42.4 (1.670) \pm 0.4 (0.016)$ mm. The side view shows a package height of $4.34 (0.171) \pm 0.79 (0.031)$ mm. The pin detail view shows a pin pitch of $2.5 (0.100)$ mm (typical), a pin width of $1.27 (0.050) \pm 0.1 (0.005)$ mm, and a pin thickness of $0.46 (0.018) \pm 0.05 (0.002)$ mm. The pin 1 identifier is located at the bottom left. The pin 15.04 (0.592) $\pm 0.3 (0.012)$ mm dimension is shown for the top view. The pin 0.84 (0.033) $\pm 0.4 (0.014)$ mm dimension is shown for the side view. The pin 0.25 (0.010) $\pm 0.05 (0.002)$ mm dimension is shown for the pin detail view. The pin 15.25 (0.600) $\pm 0.25 (0.010)$ mm dimension is shown for the pin detail view.
