

MOS INTEGRATED CIRCUIT

μ PD77015,77017,77018

16 bits, Fixed-point Digital Signal Processor

 μ PD77015, 77017, 77018 are 16 bits fixed-point DSPs (Digital Signal Processors) developed for digital signal processing with its demand for high speed and precision.

FEATURES

- FUNCTIONS
 - Instruction cycle: 30 ns (MIN.)
 Operation clock: 33 MHz

External clock: 33, 16.5, 8.25, 4.125 MHz

Crystal: 33 MHz

- · On-chip PLL to provide higher operation clock than the external clock
- · Dual load/store
- · Hardware loop function
- · Conditional execution
- · Executes product-sum operation in one instruction cycle
- PROGRAMMING
 - 16 bits × 16 bits + 40 bits → 40 bits multiply accumulator
 - 8 general registers (40 bits each)
 - 8 ROM/RAM data pointer: each data memory area has 4 registers
 - 10 source interrupts (external: 4, internal: 6)
 - 3 operand instructions (example: R0 = R0 +R1L*R2L)
 - · Nonpipeline on execution stage
- MEMORY AREAS
 - Instruction memory area: 64K words × 32 bits
 - Data memory areas : 64K words \times 16 bits \times 2 (X memory, Y memory)
- CLOCK GENERATOR
 - · Mask option for CLKOUT pin:

Fixed to the low level.

Does not output the internal system clock.

· Selectable source clock: external clock input and crystal resonator

[External clock]

On-chip PLL to provide higher operation clock (33 MHz MAX.) than the external clock.

Variable multiple rates (1, 2, 4, 8) by mask option.

[Crystal resonator]

Oscillation frequency corresponds directly to the system clock frequency (Sure to specify the mask option frequency multiple as "1").

In this document, all descriptions of the μ PD77017 also apply to the μ PD77015 and μ PD77018, unless otherwise specified.

The information in this document is subject to change without notice.

• ON-CHIP PERIPHERAL

• I/O port: 4 bits

Serial I/O (16 bits): 2 channelsHost I/O (8 bits): 1 channel

• CMOS

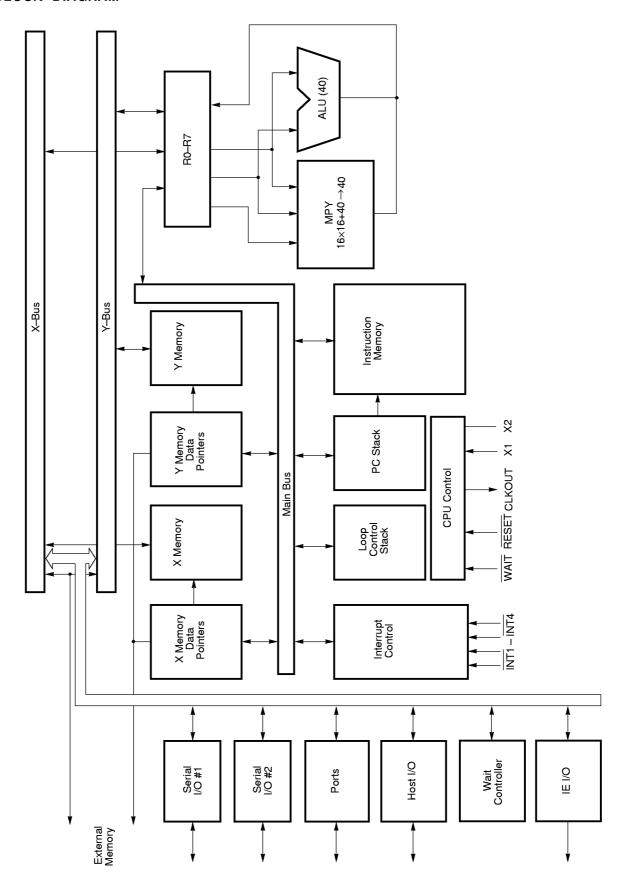

• +3 V single power supply

1. PIN FUNCTIONS

1.1 Pin Functions

Power supply

Symbol	Pin No.	1/0	Function
V _{DD}	11, 21, 31, 37, 43, 56, 69, 86, 97	-	+3V power supply
GND	10, 20, 30, 36, 42, 55, 68, 83, 96	-	Ground

• System control

Symbol	Pin No.	1/0	Function
X1	85	I	Clock input / crystal connection pin • The clock signal is connected to X1, when using external clock for system clock.
X2	84	-	Crystal connection pin • X2 should be left open when using external clock for system clock.
CLKOUT	87	0	Internal system clock output
RESET	1	I	Internal system reset signal input

Interrupt

Symbol	Pin No.	I/O	Function
ĪNT4 - ĪNT1	2 - 5	I	Maskable external interrupt input • Falling edge detection

• External data memory interface

Symbol	Pin No.	1/0	Function
X/Y	7	O (3S)	Memory select signal output O: X memory is used. 1: Y memory is used.
DA13 - DA0	8, 9, 12 -19, 22 - 25	O (3S)	Address bus to external data memory External data memory is accessed. During the external memory is not accessed, these pins keep the previous level. These pins are set to low level; 0000H, by reset. They continue outputting low level until the first external memory access.
D15 - D0	26 -29, 32 - 35, 38 - 41, 44 - 47	I/O (3S)	16 bits data bus to external data memory External data memory is accessed.
MRD	98	O (3S)	Read output Reads external memory
MWR	95	O (3S)	Write output Writes external memory
WAIT	100	l	Wait signal input • Wait cycle is input when external memory is read. 1: No wait 0: Wait
HOLDRQ	93	I	Hold request signal input Input low level when external data memory bus is expected to use.
BSTB	99	0	Bus strobe signal output • Outputs low level while the μPD77017 is occupying external memory bus.
HOLDAK	94	0	Hold acknowledge signal output Outputs low level when the μPD77017 permits external device to use external data memory bus.

Remark The state of the pins added 3S becomes high impedance when bus release signal ($\overline{HOLDAK} = 0$) is output.

· Serial interface

Symbol	Pin No.	I/O	Function
SCK1	50	I	Clock input for serial 1
SORQ1	53	0	Serial output 1 request
SOEN1	54	I	Serial output 1 enable
SO1	52	O (3S)	Serial data output 1
SIEN1	49	I	Serial input 1 enable
SI1	48	I	Serial data input 1
SCK2	59	Ι	Clock input for serial 2
SOEN2	57	I	Serial output 2 enable
SO2	58	O (3S)	Serial data output 2
SIEN2	60	I	Serial input 2 enable
SI2	61	I	Serial data input 2
SIAK1	51	0	Serial input 1 acknowledge

Remark The state of the pins added 3S becomes high impedance, when data output have been finished or RESET is input.

· Host interface

Symbol	Pin No.	1/0	Function
HA1	82	ſ	Specifies register which HD7 to HD0 access 1: Accesses HST: Host interface status register when HA1 = 0 0: Accesses HDT(in): Host transmit data register when HWR = 0 0: Accesses HDT(out): Host receive data register when HRD = 0
нао	81	I	Specifies bits of registers which HD7 to HD0 access 1: Accesses bits 15-8 of HST, HDT(in) or HDT(out) 0: Accesses bits 7-0 of HST, HDT(in) or HDT(out)
HCS	78	I	Chip select input
HRD	79	I	Host read input
HWR	80	I	Host write input
HRE	66	0	Host read enable output
HWE	67	0	Host write enable output
HD7 - HD0	70 - 77	I/O (3S)	8 bits host data bus

Remark The state of the pins added 3S becomes high impedance when the host does not access host interface.

• I/O port

Symbol	Pin No.	I/O	Function
P3 - P0	62 - 65	1/0	I/O port

Debugging interface

Symbol	Pin No.	1/0	Function
TDO	88	0	For debugging
TICE	89	0	For debugging
тск	90	I	For debugging
TDI	91	I	For debugging
TMS	92	1	For debugging

Other

Symbol	Pin No.	I/O	Function
I.C.	6	-	Internal connected pin. Leave this pin open. Caution When any signal is applied to or read out from this pin, normal operation of the μ PD77017 is not assured.

1.2 Recommended Connection for Unused Pins

Pin	I/O	Recommended connection
INT1 - INT4	Ι	connect to VDD
X/Y	0	open
DA0 - DA13	0	
D0 - D15 ^{Note1}	1/0	connect to V _{DD} or GND, via a resistor
MRD	0	open
MWR	0	
WAIT	ı	connect to VDD
HOLDRQ	_	
BSTB	0	open
HOLDAK	0	
SCK1, SCK2	_	connect to V _{DD} or GND
SI1, SI2	I	
SOEN1, SOEN2	-	connect to GND
SIEN1, SIEN2	_	
SORQ1	0	open
SO1, SO2	0	
SIAK1	0	
HAO, HA1	I	connect to VDD or GND
HCS	I	connect to VDD
HRD	1	
HWR	-	
HRE	0	open
HWE	0	
HD0 - HD7 ^{Note2}	1/0	connect to V _{DD} or GND, via a resistor
P0 - P3	1/0	
тск	-	connect to GND, via a resistor
TDO, TICE	0	open
TMS, TDI	I	open(pull-up internally)
CLKOUT	0	open

Note 1. Can leave open, if no access to external data memory is executed in the whole of program.

2. Can leave open, if \overline{HCS} , \overline{HRD} , \overline{HWR} are fixed to high level.

Remark I: Input pin

O: Output pin

I/O: Input/Output pin

2. FUNCTIONS

2.1 Pipeline Processing

This section describes the μ PD77017 pipeline processing.

2.1.1 Outline

The μ PD77017 basic operations are executed in following 3-stage pipeline.

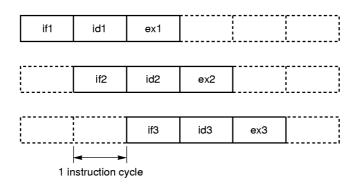

(1) instruction fetch; if

(2) Instruction decoding; id

(3) execution; ex

When the μ PD77017 operates a result of a instruction just executed before, the data is input to ALU in parallel with written back to general registers. Pipeline processing actualizes programming without delay time to execute instructions and write back data. Three successive instructions and their processing timing are shown below.

Pipeline Processing Timing

2.1.2 Instructions with Delay

The following instructions have delay time in execution.

- (1) Instructions to control interrupt
 - 2 instruction cycles have been taken between instruction fetch and execution.
- (2) Inter-register transfer instructions and immediate data set instructions

 When data is set in data pointer, it needs 2 instruction cycles before the data is valid.

2.2 Program Control Unit

Program control unit controls not only count up of program counter in normal operation, but loop, repeat, branch, halt and interrupt.

In addition to loop stack of loop 4 level and program stack of 15 level, software stack can be used for multi-loop and multi-interrupt/subroutine call.

The μ PD77017 has external 4 interruptions and internal 6 interruptions from peripheral, and specifies interrupt enable or disable independently.

The HALT and STOP instructions cause the μ PD77017 to place in low power standby mode.

When the HALT instruction is executed, power consumption decreases. HALT mode is released by interrupt input or hardware reset input. It takes several system clock to recover.

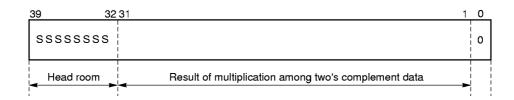

When the STOP instruction is executed, power consumption decreases. STOP mode is released by hardware reset input. It takes a few ms to recover.

2.3 Operation Unit

Operation unit consists of the following five parts.

- 40 bits general register × 8 for data load/store and input/output of operation data
- 16 bits \times 16 bits + 40 bits \rightarrow 40 bits multiply accumulator
- 40 bits Data ALU
- 40 bits barrel shifter
- SAC: shifter and count circuit.

Standard word length is 40 bits to make overflow check and adjustment easy, and to accumulate the result of 16 bits \times 16 bits multiplication correctly.

2.3.1 General register (R0 to R7)

The μ PD77017 has eight 40 bits registers for operation input/output and load/store with memory. General register consists of the following three parts.

- R0L to R7L (bit 15 to bit 0)
- R0H to R7H (bit 31 to bit 16)
- R0E to R7E (bit 39 to bit 32)

But each of RnL, RnH and RnE are treated as a register in the following conditions.

(1) General register used as 40 bits register

General registers are treated as 40 bits register, when they are used for the following aims.

- (a) Operand for triminal operation (except for multiplier input)
- (b) Operand for dyadic operation (except for multiplier and shift value)
- (c) Operand for monadic operation (except for exponent instructions)
- (d) Operand for operation
- (e) Operand for conditional judge
- (f) Destination for load instruction (with sign extension and 0 clear)

(2) General register used as 32 bits register

Bit 31 to bit 0 of general register are treated as 32 bits register, when it is used for a operand of exponent instruction.

(3) General register used as 24 bits register

Bit 39 to bit 16 of general register are treated as 24 bits register, when it is used for destination with extended sign for a load/store instruction.

(4) General register used as 16 bits register

Bit 31 to bit 16 of general register are treated as 16 bits register, when it is used for the following aims.

- (a) Signed operand for multiplier
- (b) Source/destination for load/store instruction

Bit 15 to bit 0 of general register are treated as 16 bits register, when it is used for the following aims.

- (c) Unsigned operand for multiplier
- (d) Shift value for shift instruction
- (e) Source/destination for load/store instruction
- (f) Source/destination for inter-register transfer instruction
- (g) Destination for immediate data set instruction
- (f) Hardware loop times

(5) General register used as 8 bits register

Bit 39 to bit 32 of general register are treated as 8 bits register, when it is used for source/destination of load/ store instruction.

2.3.2 MAC: Multiply ACcumulator

MAC multiplies a pair of 16 bits data, and adds or subtract the result and 40 bits data. MAC outputs 40 bits data.

MAC operates three types of multiplication: signed data \times signed data, signed data \times unsigned data and unsigned data \times unsigned data.

Result of multiplication and 40 bits data for addition can be added after 1 or 16 bits arithmetic shift right.

2.3.3 ALU: Arithmetic Logic Unit

ALU performs arithmetic operation and logic operation. Both input/output data are 40 bits.

2.3.4 BSFT: Barrel ShiFTer

BSFT performs shift right/left operation. Both input/output data are 40 bits. There are two types of shift right operations; arithmetic shift right which sign is extended, and logic shift right which is input 0 in MSB first.

2.3.5 SAC: Shifter And Count Circuit

SAC calculates and outputs shift value for normalization. SAC is input 32 bits data and outputs the 40 bits data. Then, bit 39 to bit 5 of output data is always 0.

2.3.6 CJC: Condition Judge Circuit

CJC judges whether condition is true or false with 40 bits input data. A conditional instruction is executed when the result is true, and not executed when the result is false.

2.4 Memory

The μ PD77017 has one instruction memory area (64K words \times 32 bits) and two data memory areas (64K words \times 16 bits each). It adopts Harvard-type architecture, with instruction memory area and data memory areas separated.

The μ PD77017 has 2 sets of data addressing units, which are dedicated for addressing data memory area. Each addressing unit consists of four data pointers, four index registers, a modulo register and addressing ALU.

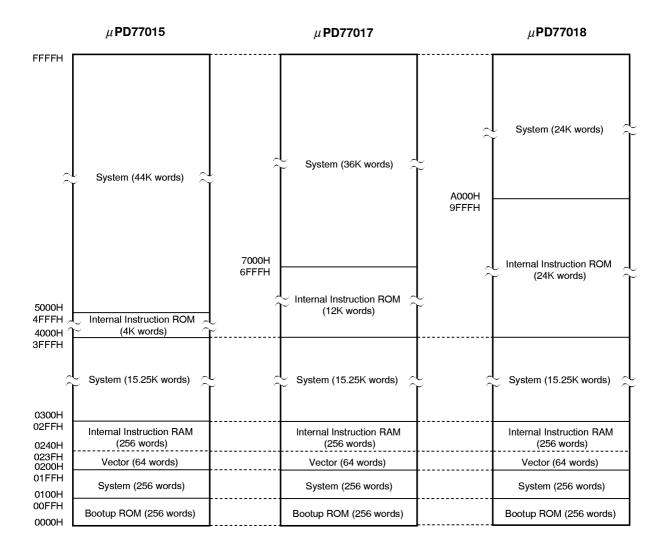

X memory area addresses are specified by DP0 to DP3, and Y memory area addresses are specified by DP4 to DP7. After memory access, DPn (with the same subscript), can be modified by DNn value. Modulo operation is performed with DMX for DP0 to DP3, with DMY for DP4 to DP7.

2.4.1 Instruction RAM Outline

The μ PD77015 has an instruction ROM (4K words \times 32 bits) and instruction RAM(256 words \times 32 bits). The μ PD77017 has an instruction ROM (12K words \times 32 bits) and instruction RAM(256 words \times 32 bits). The μ PD77018 has an instruction ROM (24K words \times 32 bits) and instruction RAM(256 words \times 32 bits).

A system vector area is assigned to 64 words of the instruction RAM. Internal instruction RAM is initialized and rewritten by boot program.

Boot up ROM contains the program loading instruction code to internal instruction RAM.

Caution When any data is accessed or stored to system address, normal operation of the device is not assured.

2.4.2 Data Memory Outline

The μ PD77015 has two data memory areas (64K words × 16 bits each) in X and Y memory areas.

Each memory areas consists of 1K words \times 16 bits data RAM and 2K words \times 16 bits data ROM . As the μ PD77017 has interface with the external data memory, 16 K words \times 16 bits external data memory space can be add to X/Y memories.

The μ PD77017 has two data memory areas (64K words × 16 bits each) in X and Y memory areas.

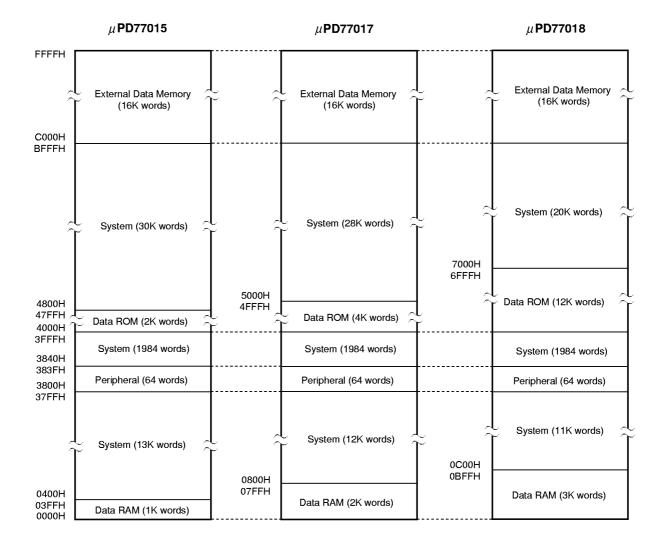

Each memory areas consists of 2K words \times 16 bits data RAM and 4K words \times 16 bits data ROM . As the μ PD77017 has interface with the external data memory, 16 K words \times 16 bits external data memory space can be add to X/Y memories.

The μ PD77018 has two data memory areas (64K words × 16 bits each) in X and Y memory areas.

Each memory areas consists of 3K words \times 16 bits data RAM and 12K words \times 16 bits data ROM . As the μ PD77018 has interface with the external data memory, 16 K words \times 16 bits external data memory space can be add to X/Y memories.

Each data memory area includes on-chip peripheral area which consists of 64 words.

When the external data memory area is accessed, instruction cycle can be 2 or more by wait function.

Caution When any data is accessed or stored to system address, normal operation of the device is not assured.

2.4.3 Data Memory Addressing

There are following two types of data memory addressing.

· Direct addressing

The address is specified in the instruction field.

· Indirect addressing

The address is specified by the data pointer (DP). DP can get a bit reverse before addressing. It can update the DP value after accessing data memory.

2.5 On-chip Peripheral Circuit

The μ PD77017 includes serial interface, host interface, general input/output ports and wait cycle registers. They are mapped in both X and Y memory areas, and are accessed as memory mapped I/O by the μ PD77017 CPU.

2.5.1 Serial Interface Outline

The μ PD77017 has 2 channel serial interfaces. Serial I/O clock must be provided from external. Frame length can be programmed independently to be 8 bits or 16 bits. MSB first or LSB first can also be selected. Data is input/output by hand shaking for an external device, and by interrupts, polling or wait function in internal.

2.5.2 Host Interface Outline

The μ PD77017 has 8 bits parallel ports as host interface to input/output data to and from host CPU and DMA controller. When an external device accesses host interface, HA0 and HA1 pins; which are host address input pins; specifies bit 15 to bit 8 and bit 7 to bit 0. The μ PD77017 includes 3 registers consisting of 16 bits, which are dedicated for input data, output data and status. The μ PD77017 has three types of interface method for internal and external data; interrupts, polling and wait function.

2.5.3 General Input/output Ports Outline

General input/output ports consist of 4 bits. User can set each port as input or output. The μ PD77017 includes two registers. One is 4 bits register for input/output data, and the other is 16 bits for control.

2.5.4 Wait Cycle Register

The wait cycle registers consist of 16 bits. It is used to set wait cycle number when external memory is accessed. When external data memory area (C000H - FFFFH) is accessed, 0, 1, 3, or 7 wait cycle can be set. When external data memory area is accessed, wait cycle can be also set by WAIT pin.

3. INSTRUCTIONS

3.1 Outline

All μ PD77017 instructions are one-word instructions, consisting of 32 bits. And they are executed in 30 ns (min.) per instruction. There are following 9 instruction types.

(1) Trinomial instructions

: specify the Acc operation. 3 of general registers are specified optionally as the operation object.

(2) Dyadic operation instructions

: specify the Acc, ALU or shifter operation. 2 of general registers are specified optionally as the operation object. Some instructions can specify a general register and immediate data.

(3) Monadic operation instructions

: specify operations by ALU. 1 general register is specified optionally as the operation object.

(4) Load/store instructions

: transfer 16 bits data from memory to general registers, from general registers to memory and between general registers.

(5) Inter-register transfer instructions

: transfer data between general register and other registers.

(6) Immediate data set instructions

: set immediate data at general registers or each registers of address operation unit.

(7) Branch instructions

: specify the direction of the program flow.

(8) Hardware loop instructions

: specify times of instruction repeating.

(9) Control Instructions

: specify the control program.

3.2 Instruction Set and Operation

An operation is written according to the rules for expressing. An expression of instructions having two or more descriptions can have only one selected.

(a) Expressions and selectable registers

Expression and selectable registers are shown as follows.

Expression	Selectable registers
ro, ro', ro"	R0 - R7
rl, rl'	R0L - R7L
rh, rh'	R0H - R7H
re	R0E - R7E
reh	R0EH - R7EH
dp	DP0 - DP7
dn	DN0 - DN7
dm	DMX, DMY
dpx	DP0 - DP3
dpy	DP4 - DP7
dpx_mod	DPn, DPn++, DPn, DPn##, DPn%%, !DPn## (n = 0 - 3)
dpy_mod	DPn, DPn++, DPn, DPn##, DPn%%, !DPn## (n = 4 - 7)
dp_imm	DPn##imm (n = 0 - 7)
***	content of memory address xxx
	Example When the content of DP0 register is 1000, *DP0 shows the content of memory address 1000.

(b) Modifying data pointers

Data pointers are modified after memory access. The results are valid immediately after instruction execution. It is impossible to modify without memory access.

Description	Operation
DPn	No operation: DPn value does not change.
DPn++	DPn ← DPn+1
DPn	DPn ← DPn−1
DPn##	DPn ← DPn + DNn: Adds DN0-DN7 corresponding to DP0-DP7
	Example DP0 ← DP0 + DN0
DPn%%	$(n = 0 - 3)$ DPn = $((DP_L + DNn) \mod (DMX + 1)) + DP_H$
	$(n = 4 - 7)$ DPn = $((DP_L + DNn) \mod (DMY + 1)) + DP_H$
!DPn##	Access memory after DPn value is bit-reversed
	After memory access, DPn \leftarrow DPn + DNn
DPn##imm	DPn ← DPn + imm

(c) Concurrent processing instructions

shows concurrent processing instruction.

Instruction names are shown in abbreviation.

TRI : Trinomial
DYAD : Dyadic
MONAD : Monadic

TRANS : Inter-register transfer IMM : Immediate data set

BR : Branch

LOOP : Hardware loop

CTR : Control

(d) State of Overflow flag (OV)

The following marks show the $\mu PD77017$ overflow flag state.

Not affected

 $\ \updownarrow$: 1 is set when the result of operation is overflow.

Caution If overflow does not occur after operation, OV is not reset, and keeps the state before operation.

V	CL

Note 1. The HALT instruction causes all function except for clock and PLL to halt. The system is placed in much less power consumption mode.

The contents of internal registers and memories are maintained.

HALT is released by interrupt input. It takes several system clock to recover.

2. The STOP instruction causes all function including clock and PLL to stop. The system is placed in a minimum-power consumption mode.

The contents of internal registers and memories are not maintained.

After the STOP instruction is executed, pin status is maintained.

STOP is released by hardware reset. It takes a few ms to recover.

4. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings (T_A = +25 °C)

Parameters	Symbol	Conditions	Ratings	Unit
Power supply voltage	V _{DD}		-0.5 to +4.6	٧
Input voltage	Vı	2.7 V ≤ V _{DD} ≤ 3.6 V	-0.5 to +4.1 Vı < Vdd +0.5 V	V
Output voltage	Vo		-0.5 to +4.6	٧
Storage temperature	Tstg		-65 to +150	,C
Operating ambient temperature	TA		-40 to +85	,C

Caution Exposure to Absolute Maximum Ratings for extended periods may affect device reliability; exceeding the ratings could cause permanent damage. The parameters apply independently. The device should be operated within the limits specified under DC and AC Characteristics.

Recommended Operating Conditions

AC Timing Test Points

AC Characteristics (T_A = -40 to +85 °C, V_{DD} = 2.7 to 3.6 V)

Clock

Required Timing Condition

Parameters	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
CLKIN cycle time	t₀cx	PLL multiple rate: 1	30		35.7	ns
		PLL multiple rate: 2	60		71.4	ns
		PLL multiple rate: 4	120		143	ns
		PLL multiple rate: 8	240		286	ns
CLKIN high level width	twcxн		13.5		tccx − 13.5 − 2trtcx ^{Note}	ns
CLKIN low level width	twcxL		13.5		t₀cx − 13.5 − 2tricx ^{Note}	ns
CLKIN rise/fall time	tricx				15	ns

Note $0.5 \text{tccx} - \text{trfcx} \ge 13.5 \text{ (MIN.)}$

Switching Characteristics

Parameters	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Internal clock cycle time	t₀c	Active mode		tccx/N ^{Note}		ns
		HALT mode		8tccx/N ^{Note}		ns
CLKOUT cycle time	t₀co			t₀c		ns
CLKOUT level width	twco		0.5t₀co – 5			ns
CLKOUT rise/fall time	trico				5	ns

Note N: PLL multiple rate (N = 1, 2, 4, 8)

★ Oscillator Circuit

Resonator	Recommended Circuit
Ceramic or crystal resonator	C1
External clock	External Clock Supply NU NU: Not Use. Leave Open.

- Cautions 1. When using system clock oscillator, wire the portion enclosed in broken lines in the figure as follows to avoid adverse influences on the wiring capacitance:
 - · Keep the wiring length as short as possible.
 - · Do not cross the wiring over the other signal lines.
 - Do not route the wiring in the vicinity of lines through which a high fluctuating current flows.
 - Always keep the ground point of the capacitor of the oscillator circuit at the same potential as GND.
 - Do not connect the power source pattern through which a high current flows.
 - Do not extract signals from the oscillator.
 - 2. When using ceramic resonator or crystal resonator, frequency multiple rate should be specified to as 1 by mask option. The device does not operate in other frequency multiple rate.

★ Recommended Oscillator Circuit Constants

	Manufacturer Name	Dort Number	Part Number Frequency (MHz)	Recommended Constants	
	Manufacturer Name	Fart Number		C1 [pF]	C2 [pF]
Ceramic Resonator	TDK	CCR33.0MC6	33.0	Internal	
	MURATA	CSA33.00MXZ040		5	5
	Manufacturing	CST33.00MXW040		Internal	
		CSACV33.00MX040		5	5
		CSTCV33.00MX040		Inte	rnal
Crystal Resonator	DAISHINKU	AT-49		10	10
		DSX840G			

Remark Recommended oscillator circuit constants may differ on the wiring capacitance of the target board the customer designed. When using a resonator for the target system, let manufacturer evaluate.

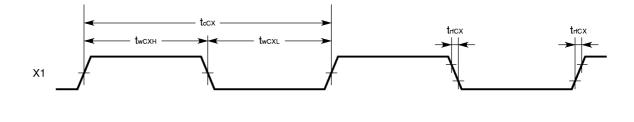

Reset, Interrupt

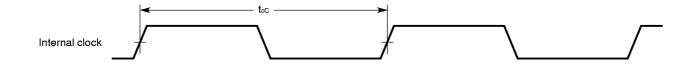

Required Timing Condition

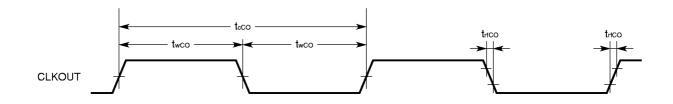

Parameters	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
RESET low level width	tw(RL)	Crystal resonator is input, at power on or STOP mode	3Note 1			ms
		External clock is input, at power on or STOP mode	100 Note 1			μs
		Active mode or HALT mode	4tccNote 2			ns
RESET recovery time	trec(R)		4t₀c			ns
INT1-INT4 low level width	tw(INTL)		3t₀cNote 2			ns
INT1-INT4 recovery time	trec(INT)		3t₀c			ns

- Note 1. The $t_{W(RL)}$ indicates a time between crystal resonator or oscillator starts to provide clock and PLL becomes stable. The $t_{W(RL)}$ depends on the rating of crystal resonator or oscillator. At power on, the $t_{W(RL)}$ is measured after the point that power supply voltage reaches to 0.8 V_{DD}.
 - 2. Note that, during HALT mode, too is extended to 8 times as long as that of Active mode.

★ Notes for Serial Clock

Serial clock inputs SCK1 and SCK2 are sensitive to any kind of interfering signals (noise on power supply, induced voltage, etc.). Spurious signals can cause malfunction of the device. Special care for the serial clock design should be taken. Careful grounding, decoupling and short wiring of SCK1 and SCK2 are recommended. Intersection of SCK1 and SCK2 with other serial interface lines or close wiring to lines carrying high frequency signals or large changing currents should be avoided.

It considers for the serial clock to make a waveform stable especially about the rising and falling.

Example 1. good exampleStraight rising form and falling form

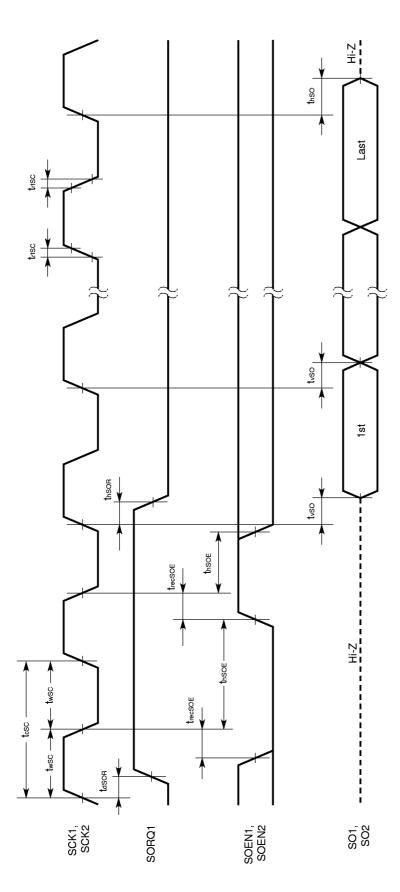

Example 2. no good example It doesn't bound. It doesn't make noise one above another.

Example 3. no good example It doesn't make a stair stepping.

6. RECOMMENDED SOLDERING CONDITIONS

When soldering these products, it is highly recommended to observe the conditions as shown below. If other soldering processes are used, or if the soldering is performed under different conditions, please make sure to consult with our sales offices.

For more details, refer to our document "SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL" (C10535E).

 μ PD77015GC- $\times\times$ -9EU: 100-pin plastic TQFP (FINE PITCH) (14mm \times 14mm)

Process	Conditions	Symbol
Infrared ray reflow	Peak temperature: 235 °C or below (Package surface temperature),	IR35-107-2
	Reflow time: 30 seconds or less (at 210 °C or higher),	
	Maximum number of reflow processes : 2 times,	
	Exposure limit Note: 7 days (10 hours pre-baking is required at 125 °C	
	afterwards).	
Vapor Phase Soldering	Peak temperature: 215 °C or below (Package surface temperature),	VP15-107-2
	Reflow time: 40 seconds or less (at 200 °C or higher),	
	Maximum number of reflow processes : 2 times,	
	Exposure limit Note: 7 days (10 hours pre-baking is required at 125 °C	
	afterwards).	
Partial heating method	Pin temperature : 300 °C or below,	
	Heat time: 3 seconds or less (Per each side of the device)	

Note Maximum allowable time from taking the soldering package out of dry pack to soldering. Storage conditions: 25 °C and relative humidity of 65 % or less.

Caution Apply only one kind of soldering condition to a device, except for "partial heating method", or the device will be damaged by heat stress.

 μ PD77017GC-×××-9EU: 100-pin plastic TQFP (FINE PITCH) (14mm × 14mm) μ PD77018GC-×××-9EU: 100-pin plastic TQFP (FINE PITCH) (14mm × 14mm)

Process	Conditions	Symbol
Infrared ray reflow	Peak temperature: 235 °C or below (Package surface temperature),	IR35-103-2
	Reflow time: 30 seconds or less (at 210 °C or higher),	
	Maximum number of reflow processes : 2 times,	
	Exposure limit Note: 3 days (10 hours pre-baking is required at 125 °C	
	afterwards).	
Vapor Phase Soldering	Peak temperature: 215 °C or below (Package surface temperature),	VP15-103-2
	Reflow time: 40 seconds or less (at 200 °C or higher),	
	Maximum number of reflow processes : 2 times,	
	Exposure limit Note: 3 days (10 hours pre-baking is required at 125 °C	
	afterwards).	
Partial heating method	Pin temperature : 300 °C or below,	
	Heat time: 3 seconds or less (Per each side of the device)	

Note Maximum allowable time from taking the soldering package out of dry pack to soldering. Storage conditions: 25 °C and relative humidity of 65 % or less.

Caution Apply only one kind of soldering condition to a device, except for "partial heating method", or the device will be damaged by heat stress.

-NOTES FOR CMOS DEVICES-

(1) PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

2 HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.
