

Description

The μ PD7227 intelligent dot-matrix LCD controller/driver is a peripheral device designed to interface most microprocessors with a wide variety of dot matrix LCDs. It can directly drive any multiplexed LCD organized as 8 rows by 40 columns, and is easily cascaded up to 16 rows and 280 columns. The μ PD7227 is equipped with several hardware logic blocks, such as an 8-bit serial interface, ASCII character generator, 40 x 16 static RAM with full read/write capability, and an LCD timing controller; all of which reduce microprocessor system software requirements. The μ PD7227 is manufactured with a single 5 V CMOS process, and is available in a space-saving 64-pin plastic flat package.

Features

- ☐ Single-chip LCD controller with direct LCD drive
- ☐ Compatible with most microprocessors
- ☐ Eight row drives
 - Designed for dot-matrix LCD configurations up to 280 dots
 - Designed for 5 x 7 dot-matrix character LCD configuration up to 8 characters
 - Cascadable to 16 row drives
- ☐ 40 column drives
 - Cascadable to 280 column drives
- ☐ Hardware logic blocks reduce system software requirements
 - 8-bit serial interface for communication
 - ASCII 5 x 7 dot-matrix character generator with 64-character vocabulary
 - 40 x 16-bit static RAM for data storage, retrieval, and complete back-up memory capability.
 - Voltage controller generates LCD bias voltages
 - Timing controller synchronizes column drives with sequentially-multiplexed row drives
- ☐ Single +5 V power supply
- ☐ CMOS technology

Pin Functions**C₀-C₃₉**

LCD column driver outputs.

R₀/8-R₇/15

LCD row driver outputs.

V_{LCD1}-V_{LCD4}

LCD bias voltage supply inputs to the LCD voltage controller. Apply appropriate voltages from a voltage ladder connected across VDD.

SI

Serial input from the microprocessor.

SO/ $\overline{\text{BUSY}}$

Serial output from the μ PD7227 to the microprocessor when in read mode and C/ $\overline{\text{D}}$ is low. When $\overline{\text{BUSY}}$ (active low), handshake output indicates the μ PD7227 is ready to receive/send the next data byte.

SCK

Serial clock input. Synchronizes 8-bit serial data transfer between the microprocessor and μ PD7227.

C/ $\overline{\text{D}}$

Command/data select input. Distinguishes serially input data byte as a command or as display data.

 $\overline{\text{CS}}$

Chip select input. Enables the μ PD7227 for communication with the microprocessor.

SYNC

Synchronization port. For multichip operation, tie all SYNC lines together and configure with the MODE SET command.

CLOCK

System clock input. Connect to external clock source.

RESET

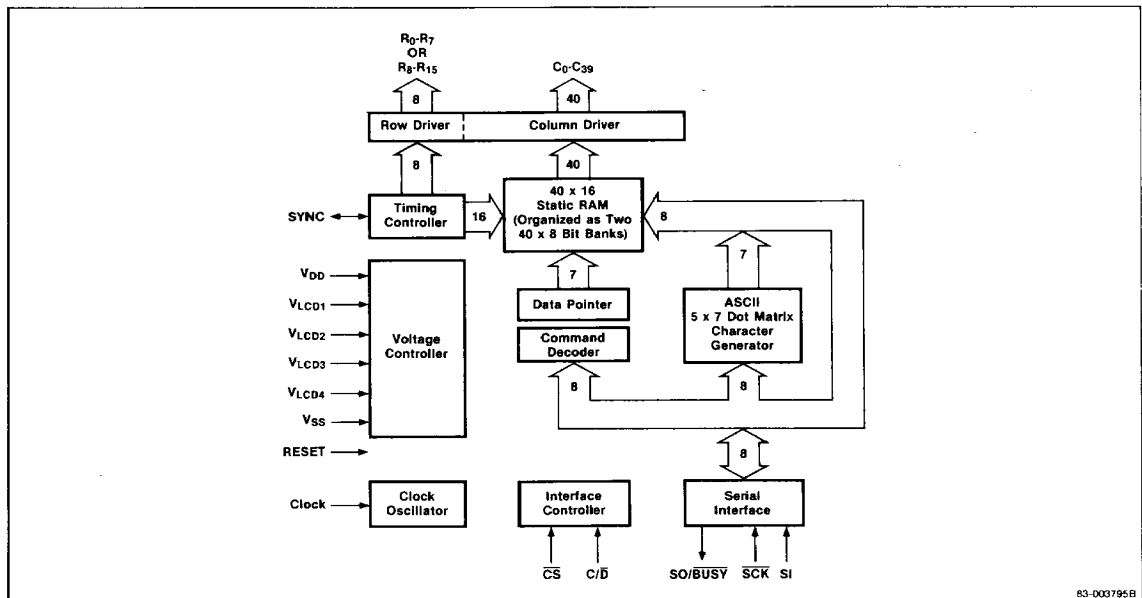

Reset input. RC circuit or pulse initializes the μ PD7227 after power-up.

VDD

Power supply positive. Apply single voltage $5\text{ V} \pm 10\%$ for proper operation.

VSS

Ground.

Absolute Maximum Ratings

T_A = 25°C

Power supply, V _{DD}	-0.3 V to +7.0 V
All inputs and outputs with respect to V _{CC}	-0.3 V to V _{DD} + 0.3 V
Storage temperature, T _{STG}	-65°C to +150°C
Operating temperature, T _{OPT}	-10°C to +70°C

Comment: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of this specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
