Note 4: These devices should not be connected to circuits with the power "ON".

Note 5: In all cases, there is approximately 5 pF of probe and jig capacitance in the output; however, this capacitance is included in  $C_L$  wherever it is specified.Note 6:  $V_{IS}$  is the voltage at the in/out pin and  $V_{OS}$  is the voltage at the out/in pin.  $V_C$  is the voltage at the control input.Note 7: Conditions for  $V_{IHC}$ : a)  $V_{IS} = V_{DD}$ ,  $I_{OS}$  = standard B series  $I_{OH}$  b)  $V_{IS} = 0\text{V}$ ,  $I_{OL}$  = standard B series  $I_{OL}$ .

## Typical Performance Characteristics

## Special Considerations

In applications where separate power sources are used to drive  $V_{DD}$  and the signal input, the  $V_{DD}$  current capability should exceed  $V_{DD}/R_L$  ( $R_L$  = effective external load of the 4 CD4066BC bilateral switches). This provision avoids any permanent current flow or clamp action of the  $V_{DD}$  supply when power is applied or removed from CD4066BC.

In certain applications, the external load-resistor current may include both  $V_{DD}$  and signal-line components. To

avoid drawing  $V_{DD}$  current when switch current flows into terminals 1, 4, 8 or 11, the voltage drop across the bidirectional switch must not exceed 0.6V at  $T_A \leq 25^\circ\text{C}$ , or 0.4V at  $T_A > 25^\circ\text{C}$  (calculated from  $R_{ON}$  values shown).

No  $V_{DD}$  current will flow through  $R_L$  if the switch current flows into terminals 2, 3, 9 or 10.
