

CD4047A Types

RECOMMENDED OPERATING CONDITIONS at $T_A = 25^\circ\text{C}$, Except as Noted.
For maximum reliability, nominal operating conditions should be selected so that operation is always within the following ranges:

CHARACTERISTIC	VDD	LIMITS				UNITS	
		D, F, K, H Packages		E Package			
		Min.	Max.	Min.	Max.		
Supply-Voltage Range (For $T_A = \text{Full Package Temperature Range}$)		3	12	3	12	V	
Input Pulse Width, t_W (Any Input)	5 10 400	— — —	1300 600 —	— — —	— — —	ns	
Trigger, Retrigger Rise or Fall Time, t_r, t_f	5 10	— —	15 5	— —	15 5	μs	

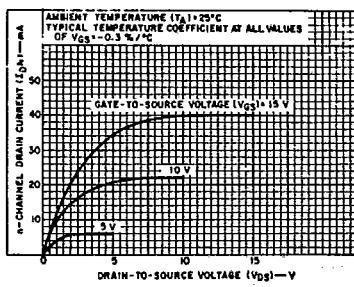

Fig. 2 – Typical output n-channel drain characteristics for Q and \bar{Q} buffers.

I. Astable Mode Design Information

A. Unit-to-Unit Transfer-Voltage Variations.

The following analysis presents worst-case variations from unit to unit as a function of transfer-voltage (V_{TR}) shift (33%–67% V_{DD}) for free-running (astable) operation.

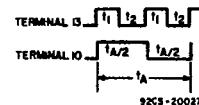

Fig. 8 – Astable mode waveforms.

$$t_1 = -RC \ln \frac{V_{TR}}{V_{DD} + V_{TR}}$$

$$t_2 = -RC \ln \frac{V_{DD} - V_{TR}}{2V_{DD} - V_{TR}}$$

$$t_A = 2(t_1 + t_2)$$

$$= -2RC \ln \frac{(V_{TR})(V_{DD} - V_{TR})}{(V_{DD} + V_{TR})(2V_{DD} - V_{TR})}$$

Typ: $V_{TR} = 0.5 V_{DD}$ $t_A = 4.40 \text{ RC}$

Min: $V_{TR} = 0.33 V_{DD}$ $t_A = 4.62 \text{ RC}$

Max: $V_{TR} = 0.67 V_{DD}$ $t_A = 4.62 \text{ RC}$

thus if $t_A = 4.40 \text{ RC}$ is used, the maximum variation will be (+5.0%, -0.0%).

CD4047A Types

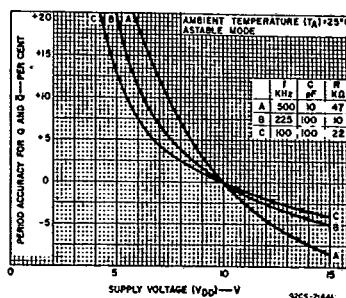

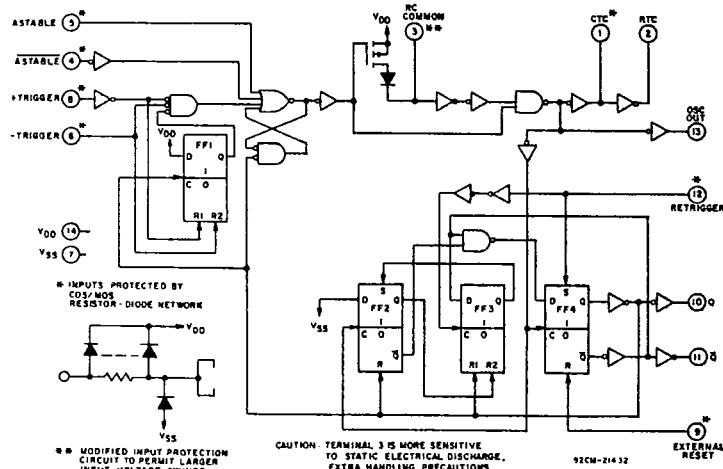

Fig. 10 - Typical Q-and- \bar{Q} -period accuracy vs supply voltage (high frequency).

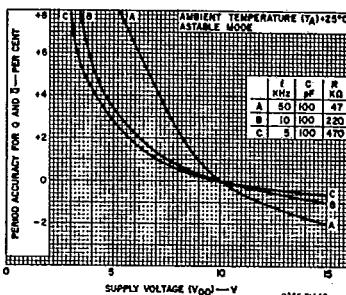

Fig. 11 - Typical Q-and- \bar{Q} -period accuracy vs supply voltage (medium frequency).

B. Variations Due to V_{DD} and Temperature Changes

In addition to variations from unit to unit, the astable period may vary as a function of frequency with respect to

V_{DD} and temperature. Typical variations are presented in graphical form in Figs. 10 to 20 with 10 V as reference for voltage variation curves and 25°C as reference for temperature variation curves.

CD4047A Types

III. Retrigger Mode Operation

The CD4047A can be used in the retrigger mode to extend the output-pulse duration, or to compare the frequency of an input signal with that of the internal oscillator. In the retrigger mode the input pulse is applied to terminals 8 and 12, and the output is taken from terminal 10 or 11. As shown in Fig. 28, normal monostable action is obtained when one retrigger pulse is applied. Extended pulse duration is obtained when more than one pulse is applied. For two input pulses, $t_{RE} = t_1' + t_1 + 2t_2$. For more than two pulses, t_{RE} (Q OUTPUT), terminates at some variable time, t_D , after the termination of the last retrigger pulse, t_D is variable because t_{RE} (Q OUTPUT) terminates after the second positive edge of the oscillator output appears at flip-flop 4 (see Fig. 8).

IV. External Counter Option

Time t_M can be extended by any amount with the use of external counting circuitry. Advantages include digitally controlled pulse duration, small timing capacitors for long time periods, and extremely fast recovery time. A typical implementation is shown in Fig. 29. The pulse duration at the output is $t_{ext} = (N-1)(t_A) + (t_M + t_A/2)$ where t_{ext} = pulse duration of the circuitry, and N is the number of counts used.

V. Timing-Component Limitations

The capacitor used in the circuit should be non-polarized and have low leakage (i.e. the parallel resistance of the capacitor should be an order of magnitude greater than the external resistor used). There is no upper or lower limit for either R or C value to maintain oscillation.

However, in consideration of accuracy, C must be much larger than the inherent stray capacitance in the system (unless this capacitance can be measured and taken into account). R must be much larger than the CMOS "ON" resistance in series with it, which typically is hundreds of ohms. In addition, with very large values of R, some short-term instability with respect to time may be noted.

The recommended values for these components to maintain agreement with previously calculated formulas without trimming should be:

$C \geq 100 \text{ pF}$, up to any practical value, for astable modes;

$C \geq 1000 \text{ pF}$, up to any practical value for monostable modes.

$$10 \text{ k}\Omega \leq R \leq 1 \text{ M}\Omega$$

VI. Power Consumption

In the standby mode (Monostable or Astable), power dissipation will be a function of leakage current in the circuit, as shown in the static electrical characteristics. For dynamic operation, the power needed to charge the external timing capacitor C is given by the following formulae:

Astable Mode: $P = 2CV^2f$. (Output at terminal No. 13)
 $P = 4CV^2f$. (Output at terminal Nos. 10 and 11)

Monostable Mode:

$$P = \frac{(2.9CV^2)}{T} \text{ (Duty Cycle)}$$

(Output at terminal Nos. 10 and 11)

The circuit is designed so that most of the total power is consumed in the external components. In practice, the lower the values of frequency and voltage used, the closer the actual power dissipation will be to the calculated value.

Because the power dissipation does not depend on R, a design for minimum power dissipation would be a small value of C. The value of R would depend on the desired period (within the limitations discussed above). See Figs. 30-32 for typical power consumption in astable mode.

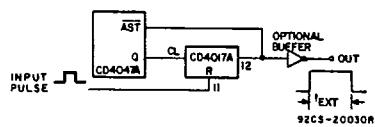

Fig. 28 — Implementation of external counter option.

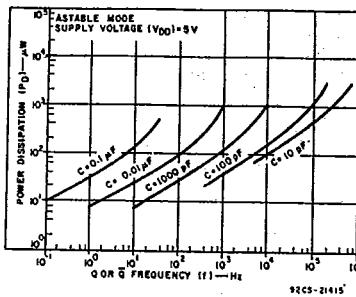

Fig. 30 — Power dissipation vs output frequency ($V_{DD} = 5 \text{ V}$).

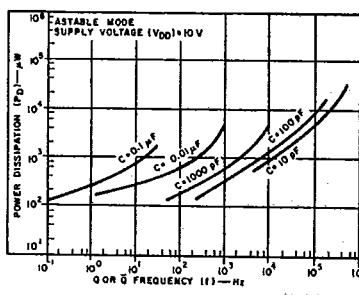

Fig. 31 — Power dissipation vs output frequency ($V_{DD} = 10 \text{ V}$).

NOTES:

Refer to Rules for Dimensioning (JEDEC Publication No. 95) for Axial Lead Product Outlines.

- When this device is supplied solder-dipped, the maximum lead thickness (narrow portion) will not exceed 0.013".
- Leads within 0.005" (0.12 mm) radius of True Position (TP) at gauge plane with maximum material condition and unit installed.
- a_A applies in zone L₂ when unit installed.
- a applies to spread leads prior to installation.
- N is the maximum quantity of lead positions.
- N₁ is the quantity of allowable missing leads.

Dimensional Outlines (Cont'd)**Dual-In-Line Plastic and Frit-Seal Ceramic Packages (Cont'd)****NOTES:**

- Refer to Rules for Dimensioning (JEDEC Publication No. 95) for Axial Lead Product Outlines.
 1. When this device is supplied solder dipped, the maximum lead thickness (narrow portion) will not exceed 0.013" (0.33 mm).
 2. Leads within 0.005" (0.12 mm) radius of True Position (TP) at gauge plane with maximum material condition and unit installed.
 3. e_A applies in zone L₂ when unit installed.
 4. e applies to spread leads prior to installation.
 5. N is the maximum quantity of lead positions.
 6. N₁ is the quantity of allowable missing leads.
