description

The UCN4810A is a monolithic BIDFET[†] integrated circuit designed to drive a dot matrix or segmented vacuum fluorescent display (VFD). This device features a serial data output to cascade additional devices for large display arrays.

A 10-bit data word is serially loaded into the shift register on the positive-going transitions of the clock. Parallel data is transferred to the output buffers through a 10-bit D-type latch while the latch enable input is high and will be latched when the latch enable is low. When the blanking input is high, all outputs are low.

Outputs are totem-pole structures formed by n-p-n emitter-follower and double-diffused MOS (DMOS) transistors with output voltage ratings of 60 volts, and 40 milliamperes source-current capability. All inputs are compatible with CMOS and TTL levels, but each requires the addition of a pull-up resistor to VDD when driven by TTL logic.

The UCN4810A is characterized for operation from 0°C to 70°C.
