

RAIL TO RAIL HIGH OUTPUT CURRENT QUAD OPERATIONAL AMPLIFIER

- RAIL TO RAIL INPUT AND OUTPUT
- LOW NOISE : **9nV/√Hz**
- LOW DISTORTION
- HIGH OUTPUT CURRENT : **80mA**
(able to drive **32Ω** loads)
- HIGH SPEED : **4MHz, 1.3V/μs**
- OPERATING FROM **2.7V** TO **12V**
- LOW INPUT OFFSET VOLTAGE : **900μV** max.
(TS925A)

- **ADJUSTABLE PHANTOM GROUND (V_{cc}/2)**
- **STANDBY MODE**

- ESD INTERNAL PROTECTION : **2kV**
- LATCH-UP IMMUNITY
- **MACROMODEL INCLUDED IN THIS SPECIFICATION**

DESCRIPTION

The TS925 is a RAIL TO RAIL quad BiCMOS operational amplifier optimized and fully specified for 3V and 5V operation.

High output current allows low load impedances to be driven. An internal low impedance PHANTOM GROUND eliminates the need for an external reference voltage or biasing arrangement.

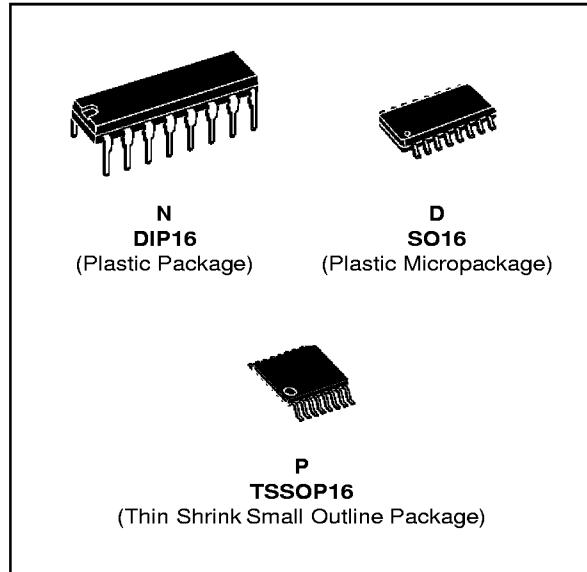

The TS925 exhibits a very low noise, low distortion and high output current making this device an excellent choice for high quality, low voltage or battery operated audio/telecom systems.

The device is stable for capacitive loads up to 500pF.

When the STANDBY mode is enabled, the total consumption drops to 6μA (V_{cc} = 3V).

APPLICATIONS

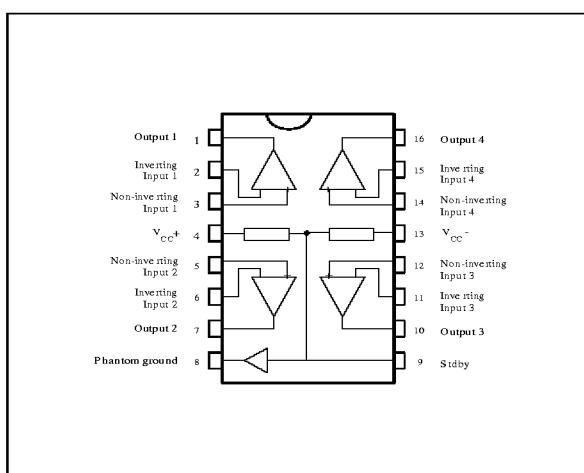

- Headphone amplifier
- Soundcard amplifier, piezoelectric speaker
- MPEG boards, multimedia systems, ...
- Cordless telephones and portable communication equipment
- Line driver, buffer
- Instrumentation with low noise as key factor

ORDER CODES

Part Number	Temperature Range	Package		
		N	D	P
TS925I	-40, +125°C	•	•	•

PIN CONNECTIONS

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage - (note 1)	14	V
V_{id}	Differential Input Voltage - (note 2)	± 1	V
V_i	Input Voltage - (note 3)	-0.3 to 14	V
T_{oper}	Operating Free Air Temperature Range	-40 to +125	°C
T_j	Maximum Junction Temperature	150	°C
R_{thja}	Thermal Resistance Junction to Ambient	130	°C/W
	Output Short-Circuit Duration	see note 4	

Notes :

1. All voltage values, except differential voltage are with respect to network ground terminal.
2. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
3. The magnitude of input and output voltages must never exceed $V_{CC} + 0.3V$.
4. Short-circuits can cause excessive heating. Destructive dissipation can result from simultaneous short-circuit on all amplifiers. Do not short circuit outputs to V_{CC} when exceeding 8V : this can induce reliability defects.

APPLICATION NOTE

PREAMPLIFIER AND SPEAKER DRIVER USING TS925

by F. MARICOURT

The TS925 is an input/output rail to rail quad BiCMOS operational amplifier. It is able to operate with low supply voltages (2.7V) and to drive low output loads such as 32Ω.

As an illustration of these features, the following technical note highlights many of the advantages of the device in a global audio application.

APPLICATION CIRCUIT

Figure 1 shows two operators (A1, A4) used in a preamplifier configuration, and the two others in a push-pull configuration driving a headset. The phantom ground is used as a common reference level ($V_{CC}/2$).

The power supply is delivered from two LR6 batteries (2x1.5V nominal).

Preamplifier : the operators A1 and A4 are wired with a non inverting gain of respectively :

- A1# ($R_4/(R_3+R_{17})$)
- A4# R_6/R_5

With the following values chosen :

- $R_4=22k\Omega$ - $R_3=50\Omega$ - $R_{17}=1.2k\Omega$
- $R_6=47k\Omega$ - $R_5=1.2k\Omega$,

the gain of the preamplifier chain is thus 58dB.

Alternatively, the gain of A1 can be adjusted by choosing a JFET transistor Q1 instead of R17.

This JFET voltage controlled resistor arrangement forms an automatic level control (ALC) circuit, useful in many MIC preamplifier applications. The mean rectified peak level of the output signal envelope is used to control the preamplifier gain.

Figure 1 : Electrical Schematic

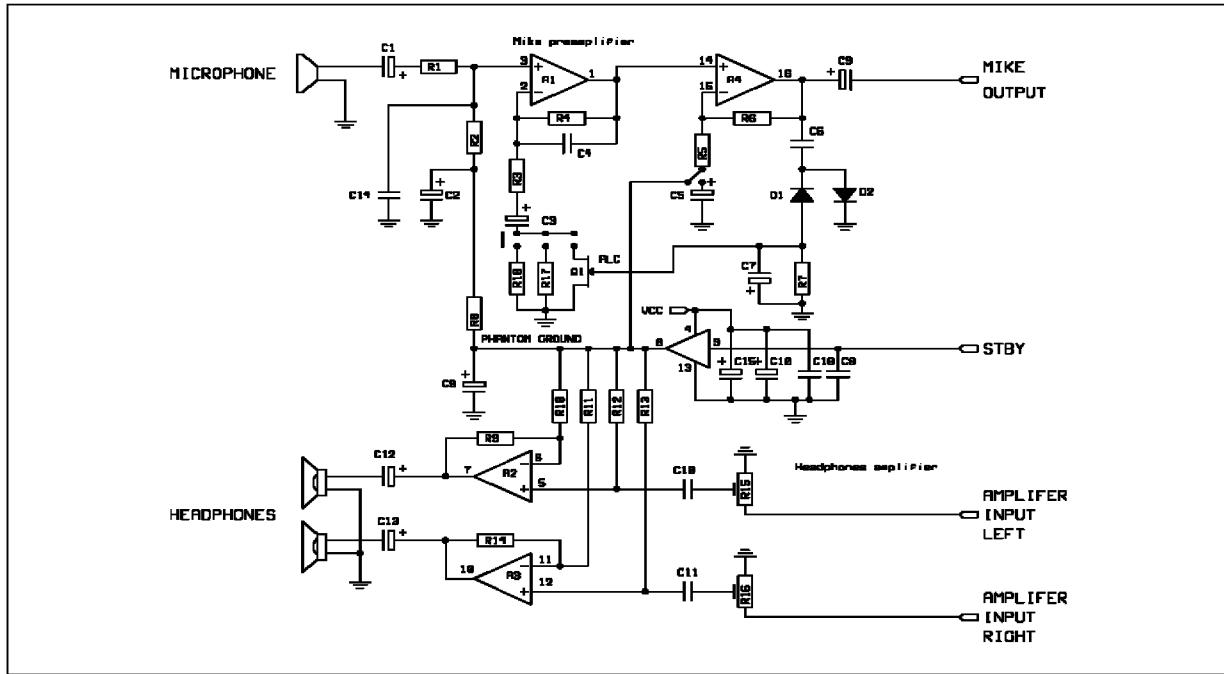

Figure 2 : Frequency Response of the Global Preamplifier Chain

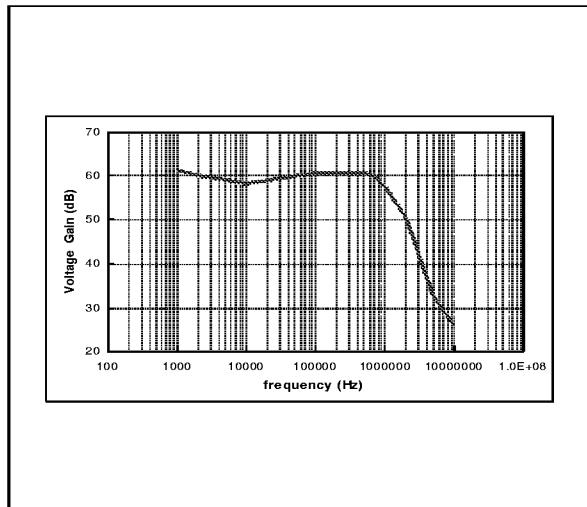

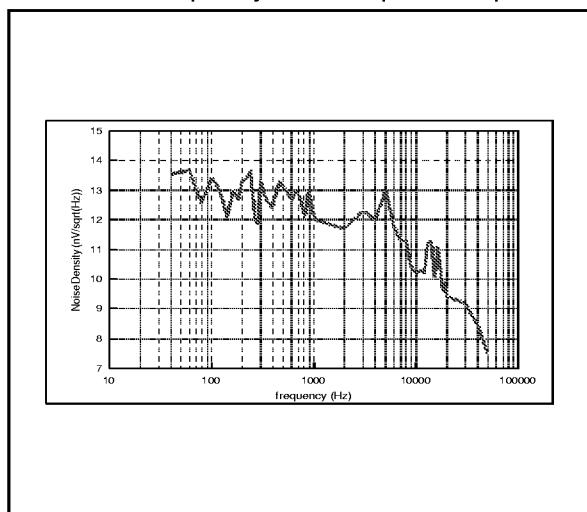

Figure 3 : Voltage Noise Density versus Frequency at Preamplifier Output

Headphone amplifier : the operators A2 and A3 are organized in a push-pull configuration with a gain of 5. The stereo inputs can be connected to a CD-player and the TS925 drives directly the headphone speakers. This configuration shows the ability of the circuit to drive 32Ω load with a maximum output swing and a high fidelity for reproducing sound and music.

Figure 4 shows the available signal swing at the headset outputs : two other rail to rail competitor parts are employed in the same circuit for comparison (note the much reduced clipping level and crossover distortion)

Figure 4 : Maximum Voltage Swing at Headphone Outputs ($R_L = 32\Omega$)

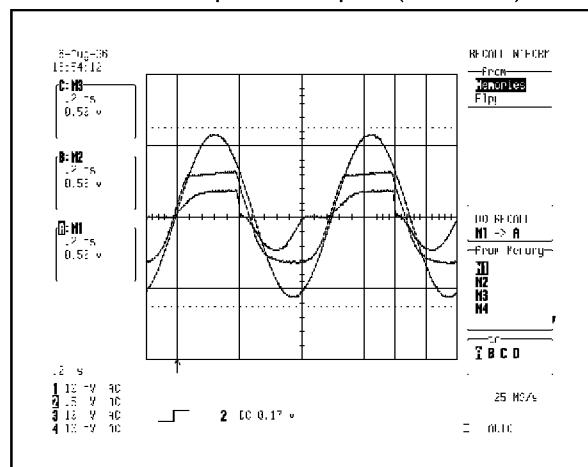

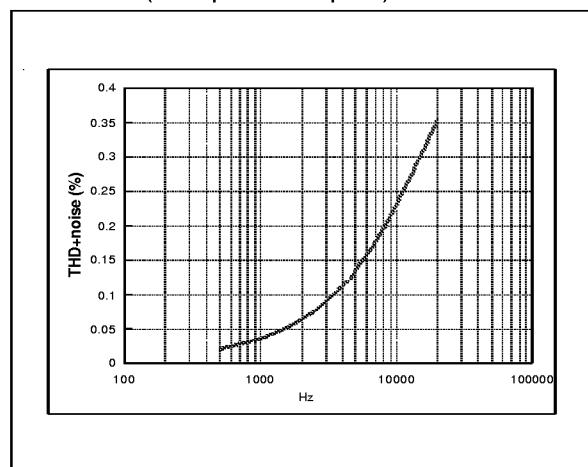

Figure 5 : THD+Noise versus Frequency (headphone outputs)

MACROMODEL
