

FULL-PACK TRIACS

Glass-passivated 4 ampere triacs in SOT-186 envelopes, which feature an electrically isolated mounting base. They are intended for use in applications requiring high bidirectional transient and blocking voltage capability. These triacs feature a high surge current capability and a range of gate current sensitivities between 5 and 50 mA. Typical applications include AC power control circuits such as motor, industrial lighting, industrial and domestic heating control and static switching systems.

QUICK REFERENCE DATA

		BT136F—500				V
		max.	500	600	700	800
Repetitive peak off-state voltage	V_{DRM}	max.	500	600	700	800
RMS on-state current	$I_T(RMS)$	max.			4	A
Non-repetitive peak on-state current						
at 50 Hz	I_{TSM}	max.			25	A
at 60 Hz	I_{TSM}	max.			30	A

MECHANICAL DATA

Dimensions in mm

Fig.1 SOT-186

Pinning:

- 1 = Terminal 1
2 = Terminal 2
3 = Gate

Net mass: 2 g.

The mounting base is electrically isolated from all terminals.

Accessories supplied on request (see data sheets Mounting instructions for F-pack devices and Accessories for SOT-186 envelopes).

MOUNTING INSTRUCTIONS

1. The triac may be soldered directly into the circuit, but the maximum permissible temperature of the soldering iron or bath is 275 °C; it must not be in contact with the joint for more than 5 seconds. Soldered joints must be at least 4.7 mm from the seal.
2. The leads should not be bent less than 2.4 mm from the seal, and should be supported during bending. The leads can be bent, twisted or straightened by 90° maximum. The minimum bending radius is 1 mm.
3. Mounting by means of a spring clip is the best mounting method because it offers good thermal contact under the crystal area and slightly lower $R_{th j-h}$ values than screw mounting. However, if a screw is used, it should be M3 cross-recess pan-head. Care should be taken to avoid damage to the plastic body.
4. For good thermal contact heatsink compound should be used between mounting base and heatsink. Values of $R_{th j-h}$ given for mounting with heatsink compound refer to the use of a metallic-oxide loaded compound. Ordinary silicone grease is not recommended.
5. Rivet mounting is not recommended.
6. The heatsink must have a flatness in the mounting area of 0.02 mm maximum per 10 mm. Mounting holes must be deburred.

FULL-WAVE CONDUCTION (with heatsink compound)

Fig.3 The right-hand part shows the interrelationship between the power (derived from the left-hand part) and the maximum permissible temperatures.

OPERATING NOTES

Dissipation and heatsink considerations:

a. The method of using Figs.3 and 4 is as follows:

Starting with the required current on the $I_T(AV)$ or $I_T(RMS)$ axis, trace upwards to meet the appropriate form factor or conduction angle curve. Trace horizontally and upwards from the appropriate value on the T_{amb} scale. The intersection determines the $R_{th\ mb-a}$. The heatsink thermal resistance value ($R_{th\ h-a}$) can now be calculated from:

$$R_{th\ h-a} = R_{th\ mb-a} - R_{th\ mb-h}$$

b. Any measurement of heatsink temperature should be made immediately adjacent to the device.

FULL-WAVE CONDUCTION (without heatsink compound)

Fig.4 The right-hand part shows the interrelationship between the power (derived from the left-hand part) and the maximum permissible temperatures.

$\alpha = \alpha_1 = \alpha_2$: conduction angle per half cycle

OVERLOAD OPERATION

Fig.5 Maximum permissible duration of steady overload (provided that T_H does not exceed 120°C during and after overload) expressed as a percentage of the steady state r.m.s. rated current. For high r.m.s. overload currents precautions should be taken so that the temperature of the terminals does not exceed 125°C . During these overload conditions the triac may lose control. Therefore the overload should be terminated by a separate protection device.

Fig.6 Maximum permissible non-repetitive r.m.s. on-state current based on sinusoidal currents ($f = 50$ Hz); $T_j = 120$ °C prior to surge. The triac may temporarily lose control following the surge.

Fig.7 On-state voltage drop (V_T) versus on-state current (I_T);
— $T_j = 25$ °C; --- $T_j = 120$ °C.

BT136F SERIES

Fig.8 Typical commutation dV/dt for BT136F series versus T_j . The triac should commute when the dV/dt is below the value on the appropriate curve for pre-commutation di_T/dt .

Fig.9 Limit commutation dV/dt for BT136F series G versus T_j . The triac should commute when the dV/dt is below the value on the appropriate curve for pre-commutation di_T/dt .

Fig.10 Typical commutation dV/dt for BT136F series F versus T_j . The triac should commute when the dV/dt is below the value on the appropriate curve for pre-commutation dI_T/dt .
