

ZN9553

1553-BUS TRANSCEIVER

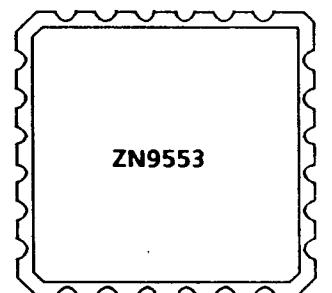

The Plessey ZN9553 monolithic transceiver is a cost effective, high performance replacement for more expensive hybrid devices. The ZN9553 transceiver is a complete transmitter and receiver pair conforming fully to MIL STD 1553B. The transceiver is available in either a 24 pin ceramic dual in line or 24 pin leadless ceramic chip carrier.

The Transceiver meets or exceeds all the requirements of MIL STD 1553B.

Due to its monolithic nature and use of digital filtering techniques, the ZN9553 Transceiver operates from +12V to +15V and +5V supplies and offers various interfacing options in a single package. (This important feature considerably reduces stock holding requirements for the user, and thus creates further cost saving for the 1553 producer and interface user).

Fig 1 Pin Connections (top view)

ABSOLUTE MAXIMUM RATINGS

Supply Voltage V _{CC1} (pin 20)	7V
Supply Voltage V _{CC2} (pin 13)	17V
Input Voltage (Control Inputs)	-0.3V to V _{CC1}
Storage Temperature range (Military)	-55°C to + 135°C
(Commercial)	-55°C to + 125°C

RECOMMENDED OPERATING CONDITIONS

Supply Voltage V _{CC1}	4.5V to 5.5V
Supply Voltage V _{CC2}	10.8V to 16.5V
Operating free air temperature (Military)	-55°C to + 125°C
(Commercial)	0°C to + 70°C

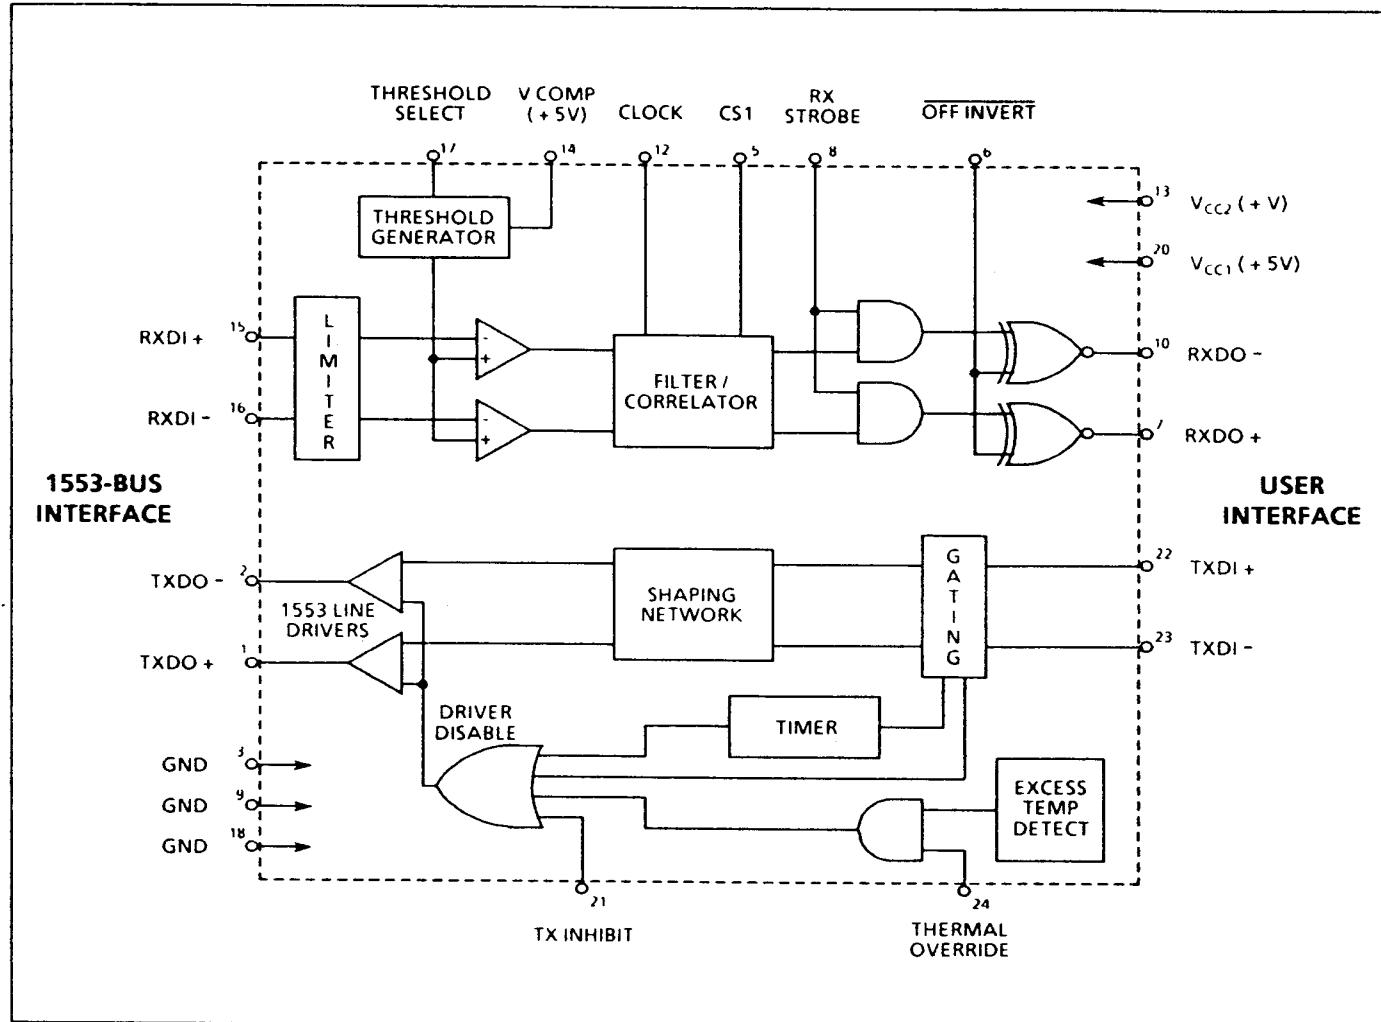

Fig 2 ZN9553 Block Diagram

PIN DESCRIPTIONS

TRANSMIT DATA IN (TXDI+, TXDI-)

These provide TTL level complementary input data to the transmit section of the ZN9553. When TXDI+ is high and TXDI- low, output TXDO+ will be driven to a more positive voltage than TXDO-. When TXDI+ is low and TXDI- high, then TXDO- will be more positive than TXDO+. If TXDI+ and TXDI- are both taken high or both low, TXDO+ and TXDO- will become high impedance.

TRANSMIT DATA OUT (TXDO+, TXDO-)

These are the complementary transmit outputs, which may be transformer coupled directly to the 1553-bus or through an isolation transformer.

RECEIVE DATA IN (RXDI+, RXDI-)

Complementary receive inputs which accept bi-phase Manchester II data from the 1553-bus.

RECEIVE DATA OUT (RXDO+, RXDO-)

These provide TTL level complementary output data from the receive section of the ZN9553. When the input voltage on RXDI+ is more positive than on RXDI-, RXDO+ will be driven high and RXDO- low. When RXDI+ is more positive than RXDI-, RXDO+ will be driven low and RXDO- high. The quiescent levels of both RXDO+ and RXDO- may be set by OFF INVERT.

TRANSMIT INHIBIT (TX INHIBIT)

This input may be used to disable the transmit data outputs. When a logic high is applied to TX INHIBIT, both TXDO+ and TXDO- will become high impedance.

RECEIVE STROBE (RX STROBE)

When RX STROBE is low, the receiver is disabled and both RXDO+ and RXDO- assume their quiescent state. When RX STROBE is high, the receiver is enabled.

OFF INVERT

This input controls the quiescent state of the receive data outputs and may be used to adapt the ZN9553 for different interface requirements. When OFF INVERT is low, RXDO+ and RXDO- will be high in their quiescent state (MCE/Smiths interface type). When OFF INVERT is high, RXDO+ and RXDO- will be low in their quiescent state (Harris or Marconi interface types).

CLOCK SELECT (CS1)

This input should be set according to the clock rate used for the Filter/Correlator circuitry. For a 10MHz (Marconi) or 12MHz (Harris) clock rate, CS1 should be left unconnected (internal pull-up resistor). For a 16MHz (MCE/Smiths) clock rate, CS1 should be connected to 0V.

THRESHOLD SELECT

This input controls the switching threshold levels of the receive data inputs and allows them to be set for different interface requirements. A higher threshold level (Harris or Marconi interface types) is selected by leaving this input unconnected (internal pull-up resistor). A lower threshold level (MCE/Smiths interface type) is selected by connecting THRESHOLD SELECT to 0V.

V COMP (+5V)

This is the reference input voltage for the receiver threshold generator. It should be connected to the 5V supply which is applied to the centre tap of the coupling or isolation transformer (see fig 5).

TTL INPUTS			1553 OUTPUTS	
TXINHIBIT	TXDI +	TXDI -	TXDO +	TXDO -
0	0	0	OFF	OFF
0	1	1	OFF	OFF
0	1	0	+ *	- *
0	0	1	- *	+ *
1	X	X	OFF	OFF

*acceptable 1553 signals are transmitted under these conditions
X = don't care

Table 1 Transmit Conditions

THERMAL OVERRIDE

The ZN9553 has an internal temperature detection circuit which disables the transmit data output drivers if the chip junction temperature exceeds 175°C. For this protection system to operate, THERMAL OVERRIDE should be left unconnected (internal pull-up resistor). To disable this feature, this input should be connected to 0V.

CLOCK

This input provides the clock to the ZN9553 Filter/Correlator circuit. The clock rate will depend on the interface type being used, but may be 10MHz (Marconi), 12MHz (Harris) or 16MHz (MCE/Smiths).

1553 INPUTS		TTL INPUTS		TTL OUTPUTS	
RXDI +	RXDI -	RXSTROBE	OFF INV	RXDO +	RXDO -
X	X	0	0	1	1
X	X	0	1	0	0
+ *	- *	1	X	1	0
- *	+ *	1	X	0	1
OFF	OFF	1	0	1	1
OFF	OFF	1	1	0	0

*assumes acceptable 1553 signal levels

X = don't care
