

Switching regulator for DC-DC converters

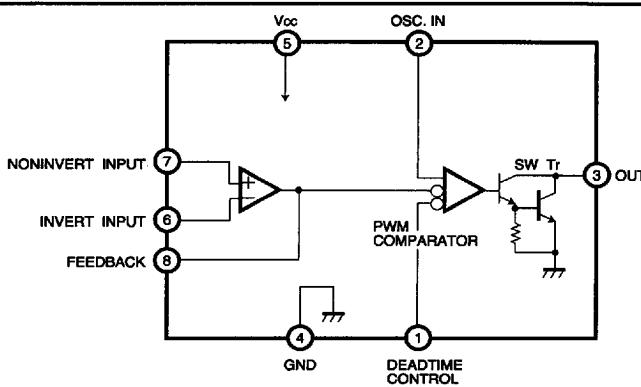

BA9701/BA9701F

The BA9701 and BA9701F are DC-DC converter switching regulators that use a pulse width modulation (PWM) system. With an error amplifier, PWM comparator, and output driver, the ICs operate by receiving reference voltage and triangular wave oscillation from a BA9700-series regulator.

●Features

- 1) The slave IC operates by receiving reference voltage and triangular waves from a BA9700-series regulator.
- 2) Contains error amplifier and PWM comparator ; the BA9701 is in an 8-pin dual-inline package, and the BA9701F is in an 8-pin SOP package.
- 3) Suited for multiple output power supply; superb cost performance in combination with BA9700A-series regulators.
- 4) Voltage output can step up, step down, or invert at an arbitrary level.
