

Agilent AT-42036

Up to 6 GHz Medium Power Silicon Bipolar Transistor

Data Sheet

Description

Agilent's AT-42036 is a general purpose NPN bipolar transistor that offers excellent high frequency performance. The AT-42036 is housed in a cost effective surface mount 100 mil micro-X package. The 4 micron emitter-to-emitter pitch enables this transistor to be used in many different functions. The 20 emitter finger interdigitated geometry yields a medium sized transistor with impedances that are easy to match for low noise and medium power applications. This device is designed for use in low noise, wideband amplifier, mixer and

oscillator applications in the VHF, UHF, and microwave frequencies. An optimum noise match near $50\ \Omega$ up to 1 GHz, makes this device easy to use as a low noise amplifier.

The AT-42036 bipolar transistor is fabricated using Agilent's 10 GHz f_T Self-Aligned-Transistor (SAT) process. The die is nitride passivated for surface protection. Excellent device uniformity, performance and reliability are produced by the use of ion-implantation, self-alignment techniques, and gold metalization in the fabrication of this device.

Thermal Resistance^[2,5]:

$$\theta_{jc} = 175^{\circ}\text{C/W}$$

Notes:

1. Permanent damage may occur if any of these limits are exceeded.
2. $T_{CASE} = 25^{\circ}\text{C}$.
3. Derate at 5.7 mW/°C for $T_c > 95^{\circ}\text{C}$.
4. Storage above +150°C may tarnish the leads of this package making it difficult to solder into a circuit.
5. The small spot size of this technique results in a higher, though more accurate determination of θ_{jc} than do alternate methods. See MEASUREMENTS section "Thermal Resistance" for more information.
