## RC144ACG 3.3V, Low Power, Integrated High Speed Data/Fax/Voice Modem Device Set with Cellular Direct Connect Support

### INTRODUCTION

The Rockwell RC144ACG integrated data/fax/voice modem device set family supports high speed data and high speed fax modem operation in the US or world-wide over a dial-up telephone line and, for US versions, a cellular phone. (Table 1 lists the models).

Small size (two PQFP or two TQFP packages), flexible power supply (supply adaptive to 3.3V or 5V), and very low power consumption make this device set ideal for laptop, notebook, and palmtop applications.

As a data modem, the modem operates at line speeds to 14400 bps. Error correction (V.42/MNP 2-4) and data compression (V.42 bis/MNP5) maximize data transfer integrity and boost average data throughput up to 57.6 kbps. Non-error-correcting mode is also supported.

As a fax modem, the modem supports Group 3 send and receive rates up to 14400 bps and supports T.30 protocol.

In voice mode, enhanced Adaptive Differential Pulse Coded Modulation coding and decoding supports efficient digital storage of voice using 2-bit or 4-bit compression and decompression at 7200 bps. Coder silence deletion and decoder silence interpolation is available to significantly increase compression rates.

Voice models operating with the parallel host bus also support business audio and the Integrated Communications System (ICS) program. The modem supports data throughput in excess of 176 kbps utilizing the Rockwell High Speed Interface (RHSI), a data rate required by 16-bit audio record/playback at 11.025 kHz. RHSI allows slower PCs such as 16 MHz 386-based computers to sustain data rates of 115.2 kbps and higher. Record and playback of monophonic (mono) audio data in 8-bit unsigned linear pulse code modulation (PCM) or 16-bit signed linear PCM format at 11.025 kHz or 7200 Hz sampling rate is supported. These features can be used in applications such as digital answering machine, voice annotation, audio file play and record, and text-to speech.

Cellular direct connect operation is supported by licensed firmware unique to a specific cellular phone type.

"AT" commands provide data, fax class 1 and class 2, MNP 10, voice/audio, cellular, and W-class functions while using minimal external ROM, RAM, and optional NVRAM.

Use of AccelerATor kits for PC half cards and PCMCIA PC cards minimize application design time and costs. The kits also include design layout files on floppy disk, sample modem devices, crystals, and full documentation.

PC-based "ConfigurACE™" software allows MCU firmware to customized to application and country requirements.

### FEATURES

- Data modem throughput up to 57.6 kbps (beyond 57.6 kbps when RHSI is active)
  - V.32 bis, V.32, V.22 bis, V.22A/B, V.23, and V.21; Bell 212A and 103
  - V.42 LAPM and MNP 2-4 error correction
  - V.42 bis and MNP 5 data compression
- MNP 10 data throughput enhancement
- Fax modem send and receive rates up to 14400 bps
  - V.17, V.29, V.27 ter, and V.21 channel 2
- Cellular direct connect
- Voice mode (option)
  - Enhanced ADPCM compression/decompression
  - Tone detection/generation and call discrimination
  - Concurrent DTMF detection
  - Timing marks
- Business audio mode (with parallel bus interface)
  - Record or playback mono data using 8-bit or 16-bit audio data encoding at 11.025 kHz or 7200 Hz
  - Concurrent DTMF/tone detection detection
- World-class operation (option)
  - Call progress and blacklisting parameters
  - Multiple country support
- Hayes AutoSync (option)
- Communication software compatible command sets
  - AT, fax class 1 and 2, and voice commands
- NVRAM directory and stored profiles
- Built-in DTE interfaces
  - DTE speed to 57.6 kbps
  - Parallel 16450 or 16550A UART interface
  - Serial CCITT V.24 (EIA/TIA-232-E)
- Rockwell High Speed Interface (RHSI)
- Automatic format/speed sensing to 57.6 kbps
- Flow control and speed buffering
- Serial sync/async data; parallel async data
- Auto dial and auto answer
- Tone, pulse, and adaptive dialing
- Calling Number Delivery (Caller ID) detect
- Extended operating temperature models available
- Flexible packaging options
  - MCU: One 80-pin PQFP or one 100-pin TQFP
  - MDP: One 100-pin PQFP or one 128-pin TQFP
- +5V operation; typical power consumption:

| Mode        | +3.3V   | +5V     |
|-------------|---------|---------|
| Operating:  | 250 mW  | 345 mW  |
| Sleep mode: | 14.6 mW | 17.9 mW |
| Sleep mode  | 8.5 mW  | 10.8 mW |

Table 1. Modem Models and Functions

| Model            | Supported Functions |         |       | Country   |
|------------------|---------------------|---------|-------|-----------|
|                  | Data/Fax            | W-Class | Voice |           |
| RC144ACG/U       | V.32 bis/V.17       | —       | —     | US/Canada |
| RC144ACGWD/U     | V.32 bis/No fax     | S       | —     | Multiple  |
| RC144ACGW/U      | V.32 bis/V.17       | S       | —     | Multiple  |
| RCV144ACG-BA     | V.32 bis/V.17       | —       | S     | US/Canada |
| RCV144ACGW(E)-BA | V.32 bis/V.17       | S       | S     | Multiple  |
| RC96ACG/U        | V.32/V.29           | —       | —     | US/Canada |
| RC96ACGWD/U      | V.32/No fax         | S       | —     | Multiple  |
| RC96ACGW/U       | V.32/V.29           | S       | —     | Multiple  |
| RCV96ACG-BA      | V.32/V.29           | —       | S     | US/Canada |
| RCV96ACGW-BA     | V.32/V.29           | S       | S     | Multiple  |

**Notes:**

- Model options:
  - BA Business audio.
  - D Data only (no fax).
  - V Voice functions.
  - W World class support.
  - (E) Optional industrial temperature range.
  - U Available only with 16550A interface.
- Supported functions (S = Supported; — = Not supported):
  - Fax Fax class 1 and class 2 command functions.
  - W-Class World class functions supporting multiple country requirements.
  - Voice Voice and business audio command functions.

## TECHNICAL SPECIFICATIONS

### GENERAL DESCRIPTION

The modem device set provides the processing core of the modem. The OEM adds a crystal, discrete components, and a digital access arrangement (DAA) and/or cellular interface circuit to complete the modem system.

#### Modem Data Pump (MDP)

The MDP is a Rockwell RC96DPG or RC144DPG data/fax/voice modem data pump packaged in a 100-pin PQFP or a 128-pin TQFP. The crystal frequency is 35.2512 MHz.

As a data modem, the MDP can operate in 2-wire, full-duplex, synchronous/asynchronous modes at line rates up to 14400 bps (RC144DPG) or 9600 bps (RC96DPG).

As a fax modem, the MDP fully supports Group 3 facsimile send and receive speeds of 14400 (RC144DPG), 12000 (RC144DPG), 9600, 7200, 4800, or 2400 bps.

ADPCM voice processing in the MDP is supported in ACG models supporting voice commands.

#### Microcontroller (MCU)

The MCU is a Rockwell L39 or P39 microcomputer packaged in an 80-pin PQFP or a 100-pin TQFP.

The MCU is a Rockwell L39 or P39 microcomputer. The MCU performs the command processing and host interface functions. The crystal frequency is 9.8304 MHz.

The L39 MCUs are packaged in an 80-pin PQFP or 100-pin TQFP.

The L39 MCU connects to the host via a V.24 (EIA/TIA-232-E) serial interface or a parallel microcomputer bus depending on installed MCU firmware. In parallel interface operation, the MCU can connect to a PCMCIA connector using a Rockwell PCMCIA Interface Control Adapter (PICA) device (see data sheet Order No. MD99) and a PCMCIA Card Information Structure (CIS) memory device.

The P39 MCU performs all the functions as the L39 MCU and, in addition, incorporates a built-in PCMCIA interface and CIS memory allowing the P39 MCU to directly connect to the PCMCIA connector without requiring these two external parts. The P39 MCU is packaged in an 128-pin PQFP. The P39 MCU interface is described in Application Note 1057, "P39 MCU (8-Bit Microcontroller with PCMCIA Interface) Application to Rockwell 14400 bps and 28800 bps Low Power Modems".

The MCU connects to the MDP via dedicated lines and the external bus. The MCU external bus also connects to OEM-supplied ROM and RAM and, high performance configuration, to the CEP. The ROM size is 128k bytes. The RAM size is 32k bytes for the low cost configuration or 8k bytes for the high performance configuration.

For all models, 256 bytes NVRAM can optionally be connected to the MCU over a dedicated serial interface.

### MCU Firmware

MCU firmware performs processing of general modem control, command sets, error correction, data compression, MNP 10, fax class 1 and class 2, voice/audio, HSI, and DTE/host interface functions. Configurations of the MCU firmware are provided to support parallel host bus interface operation or serial DTE interface operation. The MCU firmware is provided in object code form for the OEM to program into external ROM. The MCU firmware may also be provided in source code form under a source code addendum license agreement.

### SUPPORTED INTERFACES

The major hardware signal interfaces of the modem device set are illustrated in Figure 1.

#### Parallel Host Bus Interface

A 16450-compatible or 16450/16550A UART-compatible parallel interface is provided depending upon modem model. Eight data lines, three address lines, four DMA request/acknowledge lines, four control/status lines, and a reset line are supported.

#### DTE Serial Interface and Indicator Outputs

A DTE serial interface and indicator/control outputs are supported.

**V.24/EIA/TIA-232-E DTE Serial Interface.** A V.24/EIA/TIA-232-E logic-compatible DTE serial interface is supported. A clock stop signal is provided which can be used to turn off transmitter and receiver clocks to the DTE in asynchronous modes.

**Indicator Outputs.** Four indicator outputs are supported.

#### NVRAM Interface

A serial interface to an optional OEM-supplied non-volatile RAM (NVRAM) is provided. Data stored in NVRAM can take precedence over the factory default settings. A 256-byte NVRAM can store up to two user-selectable configurations and can store up to four 35-digit dial strings.

#### Speaker Interface

A speaker output, controlled by AT commands, is provided for an optional OEM-supplied speaker circuit.

#### External Bus Interface

The MCU external bus connects to the MDP and to OEM-supplied ROM, and RAM. This non-multiplexed bus supports eight bidirectional data lines and 17 address output lines. Read enable, write enable and chip select outputs (MDP select, ROM select, and RAM select) are also supported.

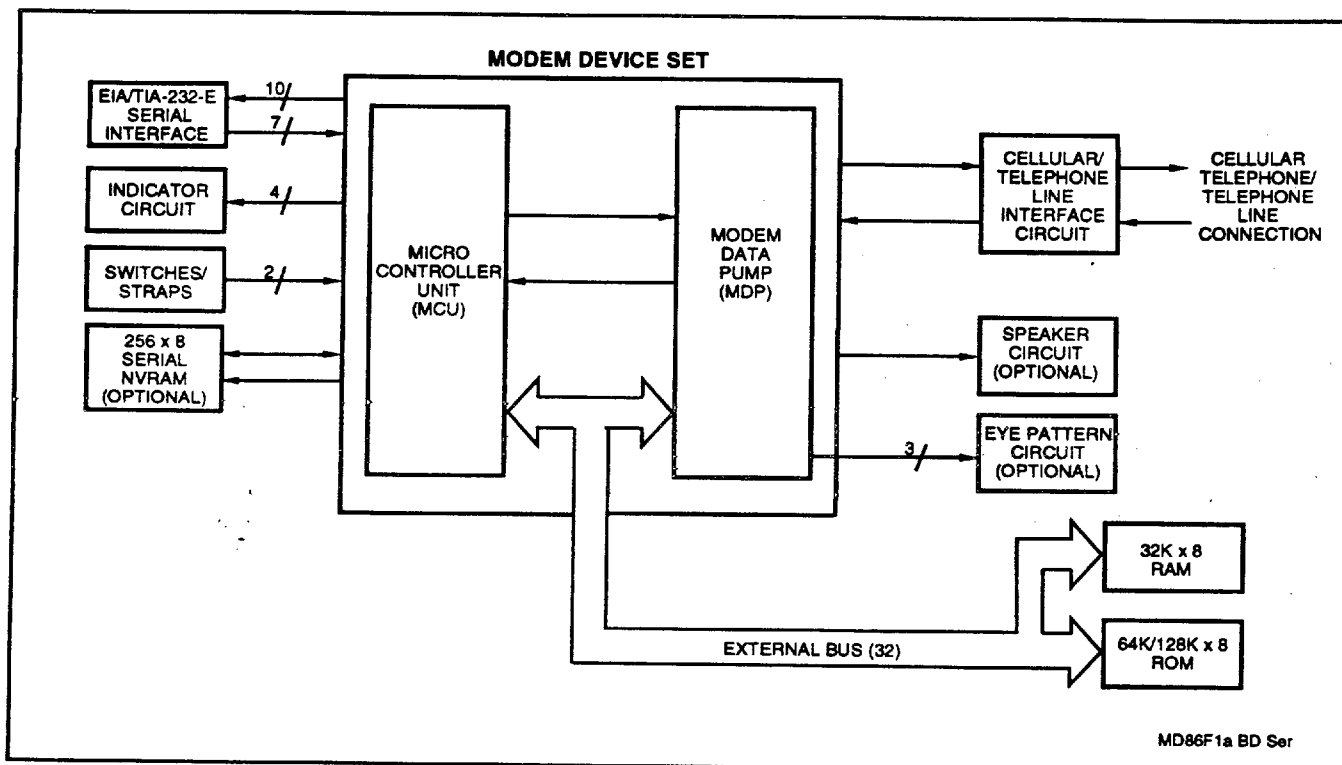

Figure 1a. Block Diagram - Serial Interface

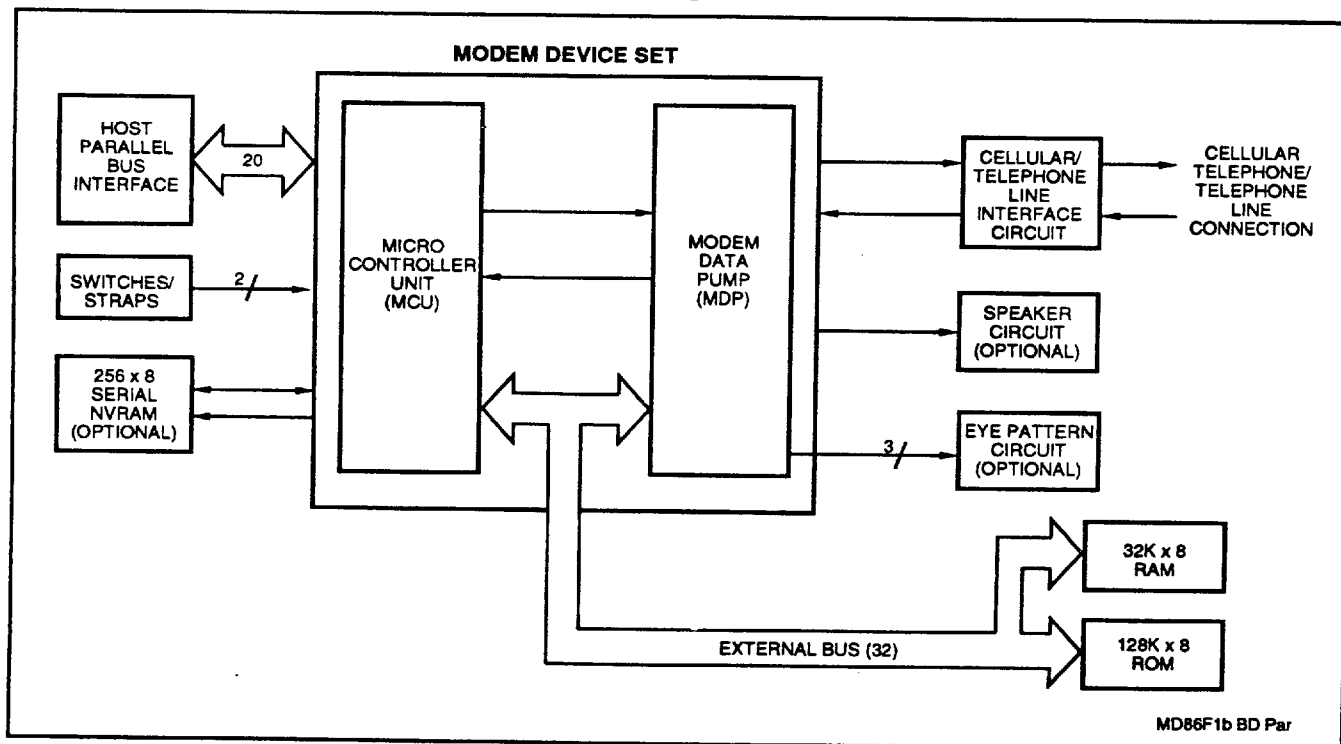

Figure 1b. Block Diagram - Parallel Interface

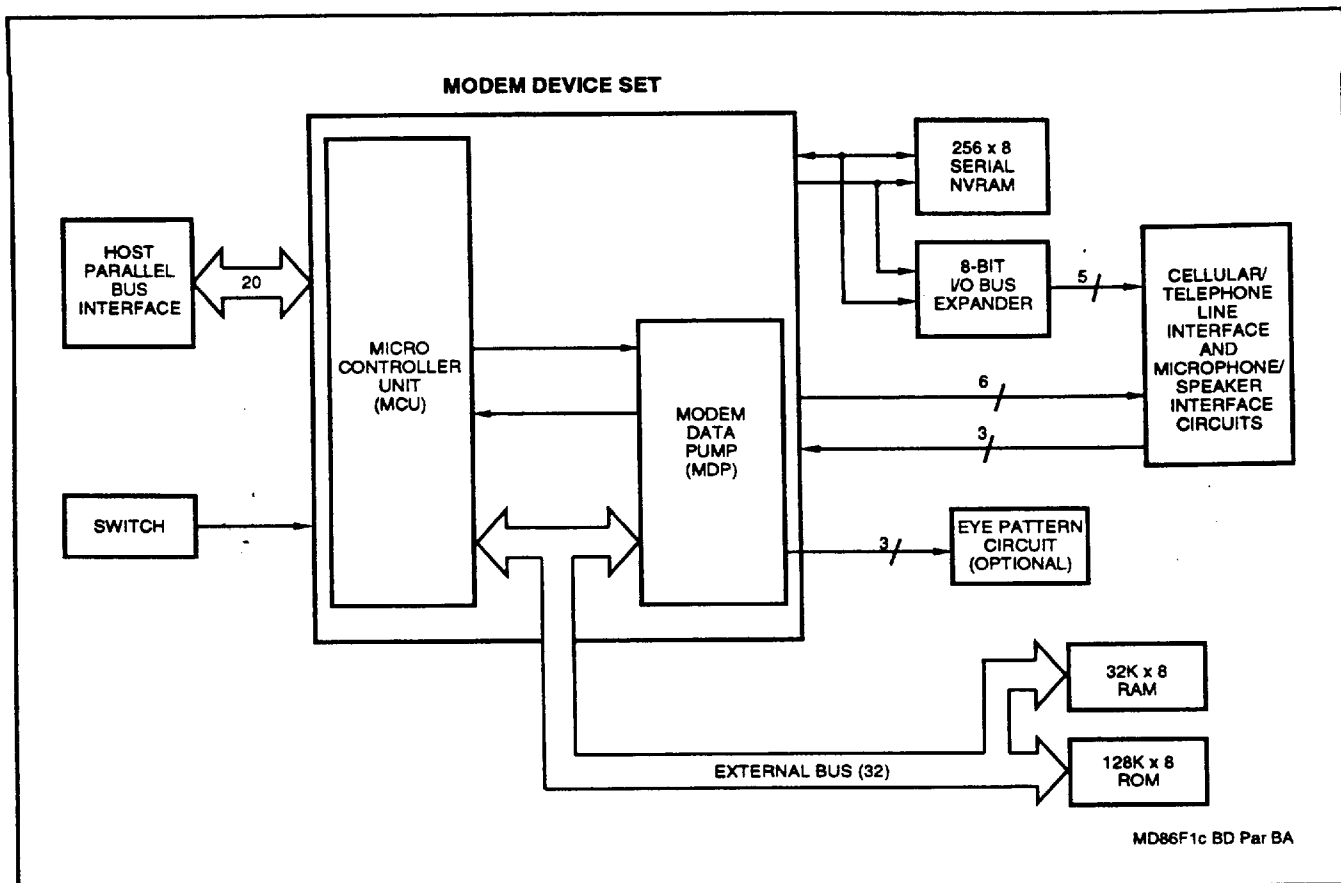

Figure 1c. Block Diagram - Parallel Interface with Business Audio

**Telephone Line Interface**

**MCU.** Wireline operation is selected when a DAA interface is indicated on the DAA/CELL input or when a cellular interface is indicated on the DAA/CELL input but no cellular firmware driver is loaded. Four relay control outputs to the line interface are supported. These outputs may be used to control relays such as off-hook, pulse, mute, A/A1, earth, and talk/data. The MCU accepts ring signal and line current sense from the line interface.

**MDP.** A receive analog input, two transmit analog outputs, two relay driver outputs, and a ring signal input are supported. The relay outputs may be used to drive Caller ID and voice relays.

**Business Audio Interface**

The MCU outputs two encoded analog switch control signals to select RIN and TXA1/TXA2 routing. In addition, three outputs are provided to select volume control, control volume up/down direction, and volume increment.

**Cellular Phone Interface**

**MCU.** Cellular operation is selected when a cellular interface is indicated on the DAA/CELL input and a cellular firmware driver is loaded. Signals supported are two encoded control outputs (CTRL0 and CTRL1), a bidirectional serial data line (CELDATA), a data clock input (CELCLK), a cellular busy output (CELBSY), and a cellular busy input (~CELBSY). Host DMA is not available in parallel interface operation when cellular is selected.

**MDP.** A receive analog input, two transmit analog outputs, two relay driver outputs, and a ring signal input are supported.

**Eye Pattern Generator Interface**

Eye pattern data, clock, and sync interface signals are provided to allow an external eye pattern generator circuit to be easily added in order to observe data modem performance relative to line impairments.

**Microsoft Windows Interface.** Microsoft Windows is supported in the host using the proprietary RHSI. The use of RHSI overcomes the limitation of predefined UART speeds. Support for RHSI is in the form of modem microcomputer firmware and Windows driver RHSICOMM.DRV. The Rockwell RHSICOMM.DRV driver is downward compatible with the standard Microsoft Windows communications driver COMM.DRV.

**COMMANDS**

The modem supports data modem, fax class 1 and 2, and MNP 10 commands, and S Registers (see Tables 2 and 3, respectively) in accordance with modem model options.

**Data Modem Operation.** Data modem functions operate in response to the basic AT commands when +FCLASS=0. Default parameters support US/Canada operation.

**MNP 10 Operation.** MNP 10 functions operate in response to MNP 10 commands.

**AutoSync Operation.** AutoSync operates in response to the &Q4 command.

**Fax Modem Operation.** Facsimile functions operate in response to fax class 1 commands when +FCLASS=1 or #CLS=1 or to fax class 2 commands when +FCLASS=2 or #CLS=2.

**Voice Operation.** Voice mode functions operate in response to voice/audio commands when #CLS=8 and #VBS=2 or #VBS=4 is selected.

**Audio Operation.** Audio mode functions operate in response to voice/audio commands when #CLS=8 and #VBS=8 or #VBS=16 is selected. Sampling rate is determined by #VSR=11025 or #VSR=7200.

**Cellular Operation.** Cellular functions operate when a cellular phone driver is loaded and a cellular phone interface is detected.

**World Class (W-Class) Operation.** Models supporting W-class functions operate in response to W-class AT commands.

**DTE SERIAL INTERFACE OPERATION****Automatic Speed/Format Sensing**

The modem can automatically determine the speed and format of the data sent from the DTE. The modem can sense speeds of 300, 600, 1200, 2400, 4800, 7200, 9600, 12000, 14400, 16800, 19200, 21600, 24000, 26400, 28800, 38400, and 57600 bps and the following data formats:

| Parity | Data Length<br>(No. of Bits) | No. of<br>Stop Bits | Character<br>Length<br>(No. of<br>Bits) |
|--------|------------------------------|---------------------|---|
| None   | 7                            | 2                   | 10                                      |
| Odd    | 7                            | 1                   | 10                                      |
| Even   | 7                            | 1                   | 10                                      |
| None   | 8                            | 1                   | 10                                      |
| Odd    | 8                            | 1                   | 11*                                     |
| Even   | 8                            | 1                   | 11*                                     |

\* 11-bit characters are sensed, but the parity bits are stripped off during data transmission in Normal and Error Correction modes. Direct mode does not strip off the parity bits.

The modem can speed sense data with mark or space parity and configures itself as follows:

| DTE Configuration | Modem Configuration |
|-------------------|---------------------|
| 7 mark            | 7 none              |
| 7 space           | 8 none              |
| 8 mark            | 8 none              |
| 8 space           | 8 even              |

**HOST PARALLEL BUS INTERFACE OPERATION**

The modem can operate at rates up to 57600 bps by programming the Divisor Latch in the parallel interface registers.

## ESTABLISHING DATA MODEM CONNECTIONS

## Telephone Number Directory

The modem supports four telephone number entries in a directory that can be saved in a serial NVRAM. Each telephone number can be up to 35 characters in length. A telephone number can be saved using the &Zn=x command, and a saved telephone number can be dialed using the DS=n command.

## Dialing

**DTMF Dialing.** DTMF dialing using DTMF tone pairs is supported in accordance with CCITT Q.23. The transmit tone level complies with Bell Publication 47001.

**Pulse Dialing.** Pulse dialing is supported in accordance with EIA/TIA-496-A.

**Adaptive Dialing.** If DTMF dialing is selected (T command) and the telephone network does not recognize DTMF tones, the modem switches to pulse dialing. If pulse dialing is selected (P command), pulse dialing is used.

**Blind Dialing.** The modem can blind dial in the absence of a dial tone if enabled by the X0, X1, or X3 command.

## Modem Handshaking Protocol

If a tone is not detected within the time specified in the S7 register after the last digit is dialed, the modem aborts the call attempt.

## Call Progress Tone Detection

Ringback, equipment busy, and progress tones can be detected in accordance with the applicable standard.

## Answer Tone Detection

Answer tone can be detected over the frequency range of  $2100 \pm 40$  Hz in CCITT modes and  $2225 \pm 40$  Hz in Bell modes.

## Ring Detection

A ring signal can be detected from a TTL-compatible 15.3 Hz to 68 Hz square wave input.

## Billing Protection

When the modem goes off-hook to answer an incoming call, both transmission and reception of data are prevented for 2 seconds (data modem) or 4 seconds (fax adaptive answer) to allow transmission of the billing signal.

## Connection Speeds

The possible data connection modes/speeds are in Table 4.

Two methods of establishing a connection are supported: use of the F command and use of N command, speed sense, and S37 register combination.

## Automode

Automode detection can be enabled by the N1 or F0 commands to allow the modem to connect to a remote modem in accordance with EIA/TIA-PN2330.

Table 2. AT Commands

| Command                  | Function  |
|--------------------------|---|
| <b>Basic AT Commands</b> |   |
| A/                       | Re-execute command  |
| A                        | Answer a call   |
| Bn                       | Set CCITT or Bell Mode  |
| Cn                       | Carrier control   |
| Dn                       | Dial (originate a call)   |
| E                        | Command echo  |
| Fn                       | Select line modulation  |
| Hn                       | Disconnect (hang-up)  |
| In                       | Identification  |
| Ln                       | Speaker volume  |
| Mn                       | Speaker control   |
| Nn                       | Automode enable   |
| On                       | Return to on-line data mode   |
| P                        | Set pulse dial default  |
| Qn                       | Quiet results codes control   |
| Sn=x                     | Write to S Register   |
| Sn?                      | Read S Register   |
| T                        | Set tone dial default   |
| Vn                       | Result code form  |
| Wn                       | Error correction message control  |
| Xn                       | Extended result codes   |
| Yn                       | Long space disconnect   |
| Zn                       | Soft reset and restore profile  |
| &Cn                      | RLSD (DCD) option   |
| &Dn                      | DTR option  |
| &F                       | Restore factory configuration (profile)                                       |
| &Gn                      | Select guard tone   |
| &Jn                      | Telephone jack control  |
| &Kn                      | Flow control  |
| &Ln                      | Leased line operation   |
| &Mn                      | Asynchronous/synchronous mode selection                                       |
| &Pn                      | Select pulse dial make/break ratio  |
| &Qn                      | Asynchronous/synchronous mode selection                                       |
| &Rn                      | RTS/CTS option  |
| &Sn                      | DSR override  |
| &Tn                      | Test and diagnostic   |
| &V                       | Display current configuration and stored profiles                             |

Table 4. Connection Speed Options

| Configuration | Rate (bps)  |
|---------------|---|
| V.32 bis      | 14400 (RC144ACG), 12000 (RC144ACG), 9600, 7200, or 4800 |
| V.32          | 9600 or 4800  |
| V.22 bis      | 2400 or 1200  |
| V.22          | 1200  |
| V.23          | 1200Tx/75Rx or 75TX/1200Rx                              |
| V.21          | 0-300   |
| Bell 212A     | 1200  |
| Bell 103      | 0-300   |

**DATA MODE**

Data mode exists when a telephone line or cellular phone connection has been established between modems and all handshaking has been completed.

**Speed Buffering (Normal Mode)**

Speed buffering allows a DTE to send data to, and receive data from, a modem at a speed different than the line speed. The modem supports speed buffering at all line speeds.

**Flow Control**

**DTE-to-Modem Flow Control.** If the modem-to-line speed is less than the DTE-to-modem speed, the modem supports XOFF/XON or RTS/CTS flow control with the DTE to ensure data integrity.

**Modem-to-Modem Flow Control.** When enabled by the \G1 command, the modem supports XON/XOFF flow control with the remote modem to ensure data integrity. Modem-to-modem flow control is not used in error correction mode. In this case, flow control is accomplished within the error-correction protocol.

**Escape Sequence Detection**

The "+++" escape sequence with guard time can be used to return control to the command mode from the data mode. Escape sequence detection is disabled by an S2 Register value greater than 127. Escape sequence detection is disabled in synchronous mode.

**BREAK Detection**

The modem can detect a BREAK signal from either the DTE or the remote modem. The \Kn command determines the modem response to a received BREAK signal.

**Telephone Line Monitoring**

**GSTN Cleardown (V.32 bis, V.32).** Upon receiving GSTN Cleardown from the remote modem in a non-error correcting mode, the modem cleanly terminates the call.

**Loss of Carrier.** If carrier is lost for a time greater than specified by the S10 register, the modem disconnects.

**Receive Space Disconnect.** If selected by the Y1 command in non-error-correction mode, the modem disconnects after receiving  $1.6 \pm 10\%$  seconds of continuous SPACE.

**Send SPACE on Disconnect**

If selected by the Y1 command in non-error-correction mode, the modem sends  $4 \pm 10\%$  seconds of continuous SPACE when a locally commanded hang-up is issued by the &Dn or H command.

**Fall Forward/Fallback (V.32 bis/V.32)**

During initial handshake, the modem will fallback to the optimal line connection within V.32 bis/V.32 mode depending upon signal quality if automode is enabled by the N1 command.

When connected in V.32 bis/V.32 mode, the modem will fall forward or fallback to the optimal line speed within V.32 bis/V.32 mode depending upon signal quality if fall forward/fallback is enabled by the %E2 command.

**Retrain**

The modem may lose synchronization with the received line signal under poor line conditions. If this occurs, retraining may be initiated to attempt recovery depending on the type of connection.

The modem initiates a retrain if line quality becomes unacceptable if enabled by the %E command. The modem continues to retrain until an acceptable connection is achieved, or until 30 seconds elapse resulting in line disconnect.

**Programmable Inactivity Timer**

The modem disconnects from the line if data is not sent or received for a specified length of time. In normal or error-correction mode, this inactivity timer is reset when data is received from either the DTE or from the line. This timer can be set to a value between 0 and 2550 seconds by using register S30. A value of 0 disables the inactivity timer.

**Synchronous Data Mode (Serial Interface Only)**

The modem can establish a synchronous connection in accordance with the &Mn or &Qn commands. Upon completing the physical handshake, the modem enters synchronous data mode. The inactivity timer is not used during synchronous data mode.

**Direct Mode (Serial Interface Only)**

The Direct mode allows data to be transmitted and received directly from the DTE and remote modem. The Direct mode is selected with the &Q0 or \N1 command. In Direct mode, no flow control characters are recognized or transmitted, the modem cannot execute error correction, and the inactivity timer is not used.

**DTE Signal Monitoring (Serial Interface Only)**

**~DTR.** When ~DTR is asserted, the modem responds in accordance with the &Dn and &Qn commands.

**~RTS.** ~RTS is used for flow control if enabled by the &K command in normal or error-correction mode or to affect the ~CTS output if enabled by the &R command in synchronous mode.

**~RDL.** When ~RDL is asserted, the modem requests a remote digital loop if connected in non-error-correction mode.

**~AL.** When ~AL is asserted, the modem disconnects and enters analog loop.

## ERROR CORRECTION AND DATA COMPRESSION

### V.42 Error Correction

V.42 supports two methods of error correction: LAPM and, as a fallback, MNP 4. The modem provides a detection and negotiation technique for determining and establishing the best method of error correction between two modems.

### MNP 2-4 Error Correction

MNP 2-4 is a data link protocol that uses error correction algorithms to ensure data integrity. Supporting stream mode, the modem sends data frames in varying lengths depending on the amount of time between characters coming from the DTE.

### V.42 bis Data Compression

V.42 bis data compression mode, enabled by the %Cn command or S46 register, operates when a LAPM or MNP 10 connection is established.

The V.42 bis data compression employs a "string learning" algorithm in which a string of characters from the DTE is encoded as a fixed length codeword. Two 2k-byte dictionaries are used to store the strings. These dictionaries are dynamically updated during normal operation.

### MNP 5 Data Compression

MNP 5 data compression mode, enabled by the %Cn command, operates during an MNP connection.

In MNP 5, the modem increases its throughput by compressing data into tokens before transmitting it to the remote modem, and by decompressing encoded received data before sending it to the DTE.

### MNP 10 DATA THROUGHPUT ENHANCEMENT

MNP 10 protocol, cellular functionality, and MNP Extended Services enhance performance under adverse channel conditions such as those found in rural, long distance, or cellular environments. An MNP 10 connection is established when an MNP 2-4 connection is negotiated with a remote modem supporting MNP 10. MNP 10 functions include:

**Robust Auto-Reliability.** A higher connection success rate is achieved by attempting to overcome channel interference during the modem negotiation phase while maintaining backward compatibility with non-MNP 10 modems.

**Negotiated Speed Upshift.** Initial connection and MNP handshake is performed at the most dependable speed, then the connection upshifts to the highest supported modem/channel speed. This function is particularly useful for channel conditions with high connection failure rates.

**Aggressive Adaptive Packet Assembly.** Frame size is dynamically changed to quickly adapt to varying levels of interference.

**Dynamic Speed Shifting.** Connection speed is shifted upward or downward to optimize data throughput for the channel conditions by continuously monitoring the line quality and link performance.

**Dynamic Transmit Level Adjustment.** When enabled by the )M2 command, transmit level is dynamically adjusted to adapt to the varying cellular network environment, and to prevent "clipping" which causes data corruption due to the Preemphasis and Compander effect.

**MNP Extended Services.** The modem can quickly switch to MNP 10 operation when the remote modem supports MNP 10 and both modems are configured to operate in V.42.

**V.42 bis/MNP 5 Support.** V.42 bis/MNP 10 can operate with V.42 bis or MNP 5 data compression.

## AUTOSYNC

Hayes AutoSync mode, when used with communications software incorporating the Hayes Synchronous Interface (HSI), provides synchronous communication capabilities from an asynchronous data terminal. In AutoSync, the modem places the call asynchronously then automatically switches to synchronous operation once the telephone connection has been established. AutoSync allows communication from an asynchronous DTE (typically a personal computer) to synchronous DTE (typically a mainframe computer or minicomputer).

## FAX CLASS 1 AND CLASS 2 OPERATION

The modem operates as a facsimile (fax) DCE whenever the +FCLASS=1 or +FCLASS=2 command is active. In the fax mode, the on-line behavior of the modem is different from the data (non-fax) mode. After dialing, modem operation is controlled by fax commands. Some AT commands are still valid but may operate differently than in data modem mode.

Calling tone is generated in accordance with T.30.

## VOICE/AUDIO MODE

Voice and audio functions are supported by the Voice Mode. Voice Mode includes three submodes: Online Voice Command Mode, Voice Receive Mode, and Voice Transmit Mode (Table 2).

**Online Voice Command Mode.** This mode results from the connection to the telephone line or a voice/audio I/O device (e.g., microphone, speaker, or handset) through the use of the #CLS=8 and #VLS commands. After mode entry, AT commands can be entered without aborting the connection.

**Voice Receive Mode.** This mode is entered when the #VRX command is active in order to record voice or audio data input at the RXA pin, typically from a microphone/handset or the telephone line.

Received analog voice samples are converted to digital form and compressed for reading by the host. AT commands control the codec bits-per-sample rate and, optionally, select silence deletion including silence detection period adjustment.

Received analog mono audio samples are converted to digital form and formatted into 8-bit unsigned linear PCM or 16-bit signed linear PCM format for reading by the host. AT commands control the bit length and sampling rate. Concurrent DTMF/tone detection is available at the 7200 Hz sample rate.

**Voice Transmit Mode.** This mode is entered when the #VTX command is active in order to playback voice or audio data to the TXA1/TXA2 output pins, typically to a speaker/handset or to the telephone line.

Digitized voice data is decompressed and converted to analog form at the original compression quantization sample-per-bits rate then output to the TXA1/TXA2 pins. Optional silence interpolation is enabled if silence deletion was selected for voice compression.

Digitized audio data is converted to analog form then output to the TXA1/TXA2 pins.

### CALLER ID

Caller ID can be enabled/disabled using the #CID command. When enabled, caller ID information (date, time, caller code, and name) can be passed to the DTE in formatted or unformatted form. Inquiry support allows the current caller ID mode and mode capabilities of the modem to be retrieved from the modem.

### CELLULAR DIRECT CONNECT

In US models, the modem provides defined hardware and firmware interfaces for connection to a cellular telephone. The modem controls downloading and execution of a cellular phone driver firmware into MCU RAM to support direct connection to a cellular phone. Different drivers are required to support different cellular phones or phone models as required by the phone manufacturer.

### Cellular Interface Signals

The following MCU ports are assigned to cellular phone interface signals:

| MCU Port | Cellular Use |     | Non-Cellular Use     |                         |
|----------|--------------|-----|----------------------|-------------------------|
|          | Signal       | I/O | DTE Serial Interface | Host Parallel Interface |
| PE0      | CTRL0        | O   | -OH                  | -OH                     |
| PE1      | CTRL1        | O   | -PULSE               | -PULSE                  |
| PE2      | CELBSY       | O   | -MUTE, -A/A1         | -MUTE, -A/A1            |
| PE5      | CELDATA      | I/O | -CLKSTOP, PTTEN*     | PTTEN*                  |
| PE7      | DAA/CELL     | I   | IDID*                | IDID*                   |
| PA3      | -CELBSY      | I   | -TXCLK               | -TXACK                  |
| PA4      | CELCCLK      | I   | -RXCLK               | -RXACK                  |

\* Used during reset initialization only in W-class models.

Support for these signals is supplied by the cellular driver. When the cellular driver is loaded and a cellular phone interface is indicated on the DAA/CELL input line, the cellular signals are used instead of the wireline signals assigned to the same lines. When the cellular driver is not loaded or when a cellular phone interface is not indicated on the DAA/CELL line when a cellular driver is loaded, the wireline signals are supported.

The cellular and wireline signals are supported in an AccelerATor Kit design and are routed to a standard 15-pin connector which connects to a cable from the cellular phone.

### Cellular AT Commands

The modem supports three cellular AT commands that can be used to load the cellular driver and to provide cellular phone identification and status.

**^C2 - Download Cellular Phone Driver.** The ^C2 command initiates download of the cellular phone driver into MCU RAM.

**^I1 - Identify Cellular Phone Driver.** The ^I1 command reports the identification of the loaded cellular phone driver.

**^T6 - Indicates Status Of Cellular Phone.** The ^T6 command reports the status of the cellular phone connection to the modem. The following bit mapped status is reported:

- Bit 0=1: Cellular phone is receiving an incoming call
- Bit 1=1: Cellular phone is in use
- Bit 2=1: Cellular phone is locked (cannot be used)
- Bit 3=1: There is no service for cellular phone (does not indicate signal strength)
- Bit 4=1: Cellular phone is powered on
- Bit 5=1: Cellular driver is initialized
- Bit 6: Reserved
- Bit 7=1: Cellular cable detected (DAA/CELL = low)

The information obtained by issuing the ^T6 can be used to determine if the loading of the cellular phone driver is necessary by the host software. Download of the cellular phone driver is not required if a cellular interface cable is not connected to the modem (DAA/CELL = high). A download is necessary when a cellular cable is detected (DAA/CELL = low), which implies a cellular phone is also connected, before operation of the phone. Once a driver is downloaded, the modem can operate in wireline mode or cellular mode based on the connection of a cellular cable.

### Operation

Once the cellular driver is loaded and the modem is connected to the cellular phone and the phone is powered on, dial/answer functions will be routed through the phone instead of the wireline DAA. No special commands are needed to place or answer cellular calls and the same AT commands and software packages that are used for wireline communication sessions can be used. If a V.42 bis connection is established in wireline mode, the cellular phone driver is removed from MCU RAM so that the V.42 bis dictionaries can be increased to their full size.

### Result Messages

While the modem is being used with a cellular phone, result messages are changed from wireline operation status to reflect cellular operation status as follows:

**NO DIALTONE** - Indicates that cellular service is not currently available or the cellular phone is powered off.

**RING** - Indicates that the cellular phone is receiving an incoming call.

## WORLD CLASS COUNTRY SUPPORT

The W-class models include functions which support modem operation in multiple countries. The following capabilities are provided in addition the data modem functions previously described. Country dependent parameters are all programmable by ConfigurACE.

### Dialing

**Dial Tone Detection.** Dial tone detection levels and frequency ranges are programmable by ConfigurACE.

**DTMF Dialing.** Transmit output level, DTMF signal duration, and DTMF interdigit interval parameters are programmable by ConfigurACE.

**Pulse Dialing.** Parameters such as make/break times, set/clear times, and dial codes are programmable by ConfigurACE.

**Ring Detection.** The frequency range is programmable by ConfigurACE.

**Blind Dialing.** Blind dialing may be disabled by ConfigurACE.

### Carrier Transmit Level

The carrier transmit level can be programmed through S91 for data and S92 for fax. The maximum, minimum, and default values can be defined by ConfigurACE to match specific country and DAA requirements.

### Calling Tone

Calling tone is generated in accordance with V.25. Calling tone may be toggled (enabled/disabled) by inclusion of a "A" character in a dial string. It may also be disabled by programming a country specific parameter using ConfigurACE.

### Call Progress Tone Detection

Frequency and cadence of tones for busy, ringback, congested, dial tone 1, and dial tone 2 are programmable by ConfigurACE.

### Answer Tone Detection

The answer tone detection period is programmable by ConfigurACE.

### Blacklist Parameters

The modem can operate in accordance with requirements of individual countries to prevent misuse of the network by limiting repeated calls to the same number when previous call attempts have failed. Call failure can be detected for reasons such as no dial tone, number busy, no answer, no ringback detected, voice (rather than modem) detected, and key abort (dial attempt aborted by user). Actions resulting from such failures can include specification of minimum inter-call delay, extended delay between calls, and maximum numbers of retries before the number is permanently forbidden ("blacklisted"). Up to 40 such numbers may be tabulated. The blacklist parameters are established by ConfigurACE.

## Relay Control

On-hook/off-hook, make/break, and set/clear relay control parameters are programmable by ConfigurACE.

## DIAGNOSTICS

### Commanded Tests

Diagnostics are performed in response to &T commands, serial interface control signals, or switch inputs per V.54.

**Analog Loopback.** Data from the local DTE is sent to the modem, which loops the data back to the local DTE.

**Analog Loop Self Test.** An internally generated test pattern of alternating 1s and 0s (reversals) is sent to the modem. An error detector within the modem checks for errors in the string of reversals.

**Remote Digital Loopback (RDL).** Data from the local DTE is sent to the remote modem which loops the data back to the local DTE.

**Remote Digital Loopback with Self Test.** An internally generated pattern is sent from the local modem to the remote modem, which loops the data back to the local modem.

**Local Digital Loopback.** When local digital loop is requested by the local DTE, two data paths are set up in the local modem. Data from the local DTE is looped back to the local DTE (path 1) and data received from the remote modem is looped back to the remote modem (path 2).

### Power On Reset Tests

Upon power on or receipt of the Z command, the modem performs tests of the MDP, RAM, ROM, and NVRAM.

## LOW POWER SLEEP AND STOP MODES

**Sleep Mode Entry.** The modem enters the low power sleep mode when no line connection exists and no host activity occurs for the period of time specified in the S24 register. All MCU circuits are turned off except the internal MCU clock circuitry in order to consume reduced power while being able to immediately wake up and resume normal operation.

**Stop Mode Entry.** The modem enters the low power stop mode when the ~STPMODE input is asserted. All MCU circuits are turned off including the internal MCU clock circuitry in order to consume lower power than sleep mode. The modem will enter stop mode immediately, terminating a line connection, terminating any test in process, and allowing any data in the Receive Buffer Register to clear.

~STPMODE must be returned high before the modem can wake-up.

**Wake-up.** Wakeup occurs when a ring is detected on the telephone line, the host writes to the modem (parallel interface version), or the DTE sends a character to the modem (serial interface version). Since the modem requires more time to attain normal operation when waking up from stop mode than sleep mode, the host must send any character to the modem before issuing the first AT command.

## CONFIGURACE UTILITY PROGRAM

The PC-based ConfigurACE utility program allows the OEM to customize the MCU firmware to suit specific application and country requirements. ConfigurACE allows programming of functions such as:

- Loading of multiple sets of country parameters
- Loading of NVRAM factory profiles
- Call progress and blacklisting parameters
- Entry of S register maximum/minimum values
- Limitation of transmit levels
- Modification of result codes
- Modification of factory default values
- Customization of the AT14 response
- Customization of fax OEM messages

This program modifies the hex object code which can be programmed directly into the system EPROM. Lists of the generated parameters can be displayed or printed.

Rockwell-provided country parameter files allow a complete set of country-specific call progress and blacklisting parameters to be selected.

## ADDITIONAL INFORMATION

Additional information is described in the RC144ACG Designer's Guide (Order No. 1008) and in the AT Command Reference Manual (Order No. 853).

## HARDWARE INTERFACES

The modem hardware interface signals for serial interface configuration is shown in Figure 2.

The modem hardware interface signals for parallel interface configuration is shown in Figure 3. Figure 3a shows the general parallel interface for cellular and W-class applications. Figure 3b shows the general interface for business audio application.

The MCU pin assignments for the 80-pin PQFP are shown in Figure 4 and are listed in Table 5.

The MCU pin assignments for the 100-pin TQFP are shown in Figure 5 and are listed in Table 6.

The MDP pin assignments for the 100-pin PQFP are shown in Figure 6 and are listed in Table 7.

The MDP pin assignments for the 128-pin TQFP are shown in Figure 7 and are listed in Table 8.

The MCU hardware interface signals are defined in Table 9.

The MDP hardware interface signals are defined in Table 10.

The digital electrical characteristics for the hardware interface signals are listed in Table 11.

The analog electrical characteristics for the hardware interface signals are listed in Table 12.

The current and power requirements are listed in Table 13.

The absolute maximum ratings are listed in Table 14.

Table 15 shows the parallel interface registers and the corresponding bit assignments.

**Notes:**

- I/O types:  
MI = Modem interconnect.  
IA, IB, IC, IE = Digital input.  
OA, OB, OE = Digital output.
- NC = No external connection.
- NU = Not used; connect as noted.
- Connect to VCC through 10 K ohms.
- Leave open to allow internal MCU ROM use; connect to GND through 10K ohms to force external ROM use only.
- Connect to GND through 10K ohms.
- Connect to GND through 100K ohms.

Table 5b. MCU Pin Signals- 80-Pin PQFP - Parallel Interface

| Pin | Signal Label                          | Type        | Interface                                | Pin | Signal Label                     | Type  | Interface                           |

## Notes:

## 1. I/O types:

MI = Modem interconnect.  
IA, IB, IE = Digital input.  
OA, OB, OE = Digital output.

## 2. NC = No external connection.

## 3. NU = Not used; connect as noted.

## 4. Connect to VCC through 10 K ohms.

## 5. Leave open to allow internal MCU ROM use; connect to GND through 10K ohms to force external ROM use only.

## 6. Connect to HB: RESET through inverter.

## Notes:

- I/O types:  
MI = Modem interconnect.  
IA, IB, IC, IE = Digital input.  
OA, OB, OE = Digital output.
- NC = No external connection.
- NU = Not used; connect as noted.
- Connect to VCC through 10 K ohms.
- Leave open to allow internal MCU ROM use; connect to GND through 10K ohms to force external ROM use only.
- Connect to GND through 10K ohms.
- Connect to GND through 100K ohms.

Table 6b. MCU Pin Signals- 100-Pin TQFP - Parallel Interface

## Notes:

## 1. I/O types:

MI = Modem interconnect.

IA, IB, IE = Digital input.

OA, OB, OE = Digital output.

## 2. NC = No external connection allowed.

## 3. NU = Not used; connect as noted.

## 4. Connect to VCC through 10 K ohms.

## 5. Leave open to allow internal MCU ROM use; connect to GND through 10K ohms to force external ROM use only.

## 6. Connect to HB: RESET through inverter.

## Notes:

## 1. I/O types:

MI = Modem interconnect.

IA, IB = Digital input.

OA, OB = Digital output.

I(DA)) = Analog input.

O(DD), O(DF) = Analog output.

## 2. NC = No external connection allowed.

## 3. Interface Legend:

PIF = Host Parallel Interface Configuration

SIF = DTE Serial Interface Configuration

WL = Wireline.

DTE = Data Terminal Equipment.

## 4. Connect to VCC through 20K ohms.

## 5. To GND through 82k ohms at DAA interface.

Table 8. MDP Pin Signals - 128-Pin TQFP

| XTLI, XTLO                    | IE, OE                              | MCU Crystal/Clock In and Crystal Out. Connects to an external crystal circuit consisting of a 9.8304 MHz crystal and a capacitance network.  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -RES                          | IC                                  | MCU Reset. The active low -RES input resets the MCU logic, and restores the saved configuration from NVRAM or returns the modem to the factory default values if NVRAM is not present. For serial interface, the -RES input is typically connected to a reset switch circuit and MDP -POR. For parallel interface, the -RES input is typically connected to the host bus RESET line through an inverter and to MDP -POR.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| DPIRQ                         | IA                                  | MDP Interrupt Request. Connects to the MDP IRQ output.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -DPRXD                        | MI                                  | MDP Received Data. Connects to the MDP RXD output (serial interface).  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |

PTTEN is checked only for countries which do not permit the use of the %TT command at the approval site (e.g., Germany).  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| NVRAM INTERFACE               |                                     |  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| NVMCLK                        | OA                                  | NVRAM Clock. NVMCLK output high enables the NVRAM.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| NVMDATA                       | IA/OA                               | NVRAM Data. The NVMDATA pin supplies a serial data interface to the NVRAM.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| EXTERNAL MEMORY BUS INTERFACE |                                     |  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| A0-A15                        | OA                                  | Address Lines 0-15. A0-A15 are the external memory bus address lines.  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| A16                           | OA                                  | Address Line 16. A16 is a bank select line.  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| D0-D7                         | IA/OA                               | Data Line 0-7. D0-D7 are the external memory bus data lines.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -READ                         | OA                                  | Read Enable. -READ output low enables data transfer from the selected device to the D0-D7 lines.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -WRITE                        | OA                                  | Write Enable. -WRITE output low enables data transfer from the D0-D7 lines to the selected device.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -DPSEL                        | OA                                  | Modem Data Pump Select. -DPSEL output low selects the MDP.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -RAMSEL                       | OA                                  | RAM Select. -RAMSEL output low selects the external RAM.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -ROMSEL                       | OA                                  | ROM Select. -ROMSEL output low selects an external ROM or flash ROM.   |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -ES1SEL                       | OA                                  | ES1 Select. -ES1SEL output low and A0 high select external input buffer 1. -ES1SEL output low and a low from A0 NANDed with -WRITE selects external input buffer 2. -ES1SEL output low clocked by -WRITE selects the external latch. (Serial interface only.)  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |
| -ES0SEL                       | OA                                  | ES0 Select. -ES0SEL output low selects an external device (not used).  |   |                                     |  |   |     |       |     |     |     |       |        |        |     |        |              |              |     |         |                  |        |     |          |       |       |     |         |        |        |     |        |        |        |

Table 9. MCU Signal Definitions (Cont'd)

| Label   | I/O Type | Signal Name/Description   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
|---|----------|---|-----|-----|-------------|---|---|---|---|---|--|---|---|---|---|---|-----------|
| <b>PARALLEL HOST INTERFACE (PARALLEL INTERFACE VERSION)</b>   |          |   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| The parallel interface emulates a 16450 or 16550A/16450 UART-compatible interface. The parallel interface is compatible with communications software designed to operate with a 16450/16550A interface. |          |   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| HA0-HA2   | IA       | <b>Host Bus Address Lines 0-2.</b> During a host read or write operation with $\sim$ HCS low, HA0-HA2 select an internal MCU 16450/16550A-compatible register.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| HD0-HD7   | IA/OA    | <b>Host Bus Data Lines 0-7.</b> HD0-HD7 are comprised of eight three-state input/output lines providing bidirectional communication between the host and the MCU. Data, control words, and status information are transferred over HD0-HD7.   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ HCS  | IA       | <b>Host Bus Chip Select.</b> $\sim$ HCS input low selects the host bus.   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ HRD  | IA       | <b>Host Bus Read.</b> $\sim$ HRD is an active low, read control input. When $\sim$ HCS is low, $\sim$ HRD low allows the host to read status information or data from a selected MCU register.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ HWT  | IA       | <b>Host Bus Write.</b> $\sim$ HWT is an active low, write control input. When $\sim$ HCS is low, $\sim$ HWT low allows the host to write data or control words into a selected MCU register.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| HINT  | OA       | <b>Host Bus Interrupt.</b> HINT output is set high when the receiver error flag, received data available, transmitter holding register empty, or modem status interrupt is asserted. HINT is reset low upon the appropriate interrupt service or master reset operation.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ TXACK  | IA       | <b>Host Transmit Acknowledge.</b> $\sim$ TXACK is an active low transmit acknowledge input, acknowledging that the DMA controller received the Transmit Ready (TXRDY) data transfer request output.   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ RXACK  | IA       | <b>Host Receive Acknowledge.</b> $\sim$ RXACK is an active low receive acknowledge input, acknowledging that the DMA controller received the Receiver Ready (RXRDY) data transfer request output.   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| TXRDY   | OA       | <b>Transmitter Ready.</b> TXRDY is an active high transmit ready output in the FIFO mode (FCR0 = 1). When asserted, TXRDY indicates that the TX FIFO is not full (i.e., the TX FIFO can accept data to be transmitted).   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| RXRDY   | OA       | <b>Receiver Ready.</b> RXRDY is an active high receiver ready output in the FIFO mode (FCR0 = 1). When asserted, RXRDY indicates that the RX FIFO is not empty (i.e., the RX FIFO has received data ready for transfer).  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| <b>8-BIT I/O EXPANDER TO MICROPHONE/SPEAKER INTERFACE (PARALLEL INTERFACE VERSION)</b>  |          |   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| SWA, SWB  | OA       | <b>Analog Switch Control.</b> Encoded outputs select the RIN and TXA1/TXA2 routing as follows: <table> <thead> <tr> <th>SWA</th><th>SWB</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>0</td><td>Data mode (connect RIN to the line and the speaker; connect TXA1/TXA2 to the line and the speaker).</td></tr> <tr> <td>0</td><td>1</td><td>Voice mode - playback or record from the line or the telephone set (connect RIN to the line; connect TXA1/TXA2 to the line).</td></tr> <tr> <td>1</td><td>0</td><td>Voice mode - record from the microphone (connect RIN to microphone input circuit; connect TXA1/TXA2 to line).</td></tr> <tr> <td>1</td><td>1</td><td>Not used.</td></tr> </tbody> </table> | SWA | SWB | Description | 0 | 0 | Data mode (connect RIN to the line and the speaker; connect TXA1/TXA2 to the line and the speaker). | 0 | 1 | Voice mode - playback or record from the line or the telephone set (connect RIN to the line; connect TXA1/TXA2 to the line). | 1 | 0 | Voice mode - record from the microphone (connect RIN to microphone input circuit; connect TXA1/TXA2 to line). | 1 | 1 | Not used. |
| SWA   | SWB      | Description   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| 0   | 0        | Data mode (connect RIN to the line and the speaker; connect TXA1/TXA2 to the line and the speaker).   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| 0   | 1        | Voice mode - playback or record from the line or the telephone set (connect RIN to the line; connect TXA1/TXA2 to the line).  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| 1   | 0        | Voice mode - record from the microphone (connect RIN to microphone input circuit; connect TXA1/TXA2 to line).   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| 1   | 1        | Not used.   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| U/ $\sim$ D   | OA       | <b>Volume Up/Down Select.</b> Controls increase (high) or decrease (low) of volume when $\sim$ INC is pulsed and $\sim$ CS = low.   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ INC  | OA       | <b>Volume Increment.</b> When $\sim$ INC is pulsed while $\sim$ CS is low, the volume is increased (U/ $\sim$ D = high) or decreased (U/ $\sim$ D = low).   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ CS   | OA       | <b>Volume Control Chip Select.</b> Enables (low) or disables (high) adjustment of volume using U/ $\sim$ D and $\sim$ INC.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| <b>LED INDICATOR CIRCUIT INTERFACE (SERIAL INTERFACE VERSION)</b>   |          |   |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ AAIND  | OA       | <b>Auto Answer Indicator.</b> $\sim$ AAIND output ON (low) corresponds to the indicator on. $\sim$ AAIND output is active when the modem is configured to answer the ring automatically (ATSO command $\neq$ 0).  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ TMIND  | OA       | <b>Test Mode Indicator.</b> $\sim$ TMIND output ON (low) corresponds to the indicator on. $\sim$ TMIND output pulses (LED flashes) when the modem is in test mode and if an error is detected.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |
| $\sim$ DTRIND   | OA       | <b>DTR Indicator.</b> $\sim$ DTRIND output ON (low) corresponds to the indicator on. The $\sim$ DTRIND state reflects the $\sim$ DTR output state except when the &D0 command is active, in which case $\sim$ DTRIND is low.  |     |     |             |   |   |   |   |   |  |   |   |   |   |   |           |

Table 9. MCU Signal Definitions (Cont'd)

| Label   | VO Type | Signal Name/Description  |
|---|---------|--|
| <b>V.24 (EIA-232-D) DTE SERIAL INTERFACE (SERIAL INTERFACE VERSION)</b>   |         |  |
| The serial interface signals correspond functionally to V.24/EIA/TIA-232-E signals. The signal levels are TTL compatible and are inverted from V.24/EIA/TIA-232-E levels. |         |  |
| -TXD  | IA      | <b>Transmitted Data (EIA BA/CCITT CT103).</b> The DTE uses the -TXD line to send data to the modem for transmission over the telephone line or to transmit commands to the modem.  |
| -RXD  | OA      | <b>Received Data (EIA BB/CCITT CT 104).</b> The modem uses the -RXD line to send data received from the telephone line to the DTE and to send modem responses to the DTE. During command mode, -RXD data represents the modem responses to the DTE.  |
| -CTS  | OA      | <b>Clear To Send (EIA CB/CCITT CT106).</b> -CTS output ON (low) indicates that the DTE is ready to accept data from the DTE. In asynchronous operation, in error correction or normal mode, -CTS is always ON (low) unless RTS/CTS flow control is selected by the &Kn command.<br><br>In synchronous operation, the modem also holds -CTS ON during asynchronous command state. The modem turns -CTS OFF immediately upon going off-hook and holds -CTS OFF until both -DSR and -RLSD are ON and the modem is ready to transmit and receive synchronous data. The modem can also be commanded by the &Rn command to turn -CTS ON in response to an -RTS OFF-to-ON transition. |
| -DSR  | OA      | <b>Data Set Ready (EIA CC/CCITT CT107).</b> -DSR indicates modem status to the DTE. -DSR OFF (high) indicates that the DTE is to disregard all signals appearing on the interchange circuits except Ring Indicator (-RI). -DSR output is controlled by the AT&Sn command.  |
| -RLSD   | OA      | <b>Received Line Signal Detector (EIA CF/CCITT CT109).</b> When AT&C0 command is not in effect, -RLSD output is ON when a carrier is detected on the telephone line or OFF when carrier is not detected.   |
| -TM   | OA      | <b>Test Mode Indicate (EIA TM/CCITT CT142).</b> The -TM output indicates the modem is in test mode (low) or in any other mode (high).  |
| -RI   | OA      | <b>Ring Indicator (EIA CE/CCITT CT125).</b> -RI output ON (low) indicates the presence of an ON segment of a ring signal on the telephone line.  |
| -DRSOUT   | OA      | <b>Data Signaling Rate Indicator (EIA CI/CCITT CT112).</b> -DRSOUT is ON (low) when the modem desires or is engaged in the high speed (2400 bps or higher) mode. -DRSOUT is OFF (high) otherwise.  |
| -DTR  | IA      | <b>Data Terminal Ready (EIA CD/CCITT CT108).</b> The -DTR input is turned ON (low) by the DTE when the DTE is ready to transmit or receive data. -DTR ON prepares the modem to be connected to the telephone line, and maintains the connection established by the DTE (manual answering) or internally (automatic answering). -DTR OFF places the modem in the disconnect state under control of the &Dn and &Qn commands.  |
| -RTS  | IA      | <b>Request To Send (EIA CA/CCITT CT105).</b> -RTS input ON (low) indicates that the DTE is ready to accept data from the modem. In the command state, the modem ignores -RTS.<br><br>In asynchronous operation, the modem ignores -RTS unless RTS/CTS flow control is selected by the &Kn command.<br><br>In synchronous on-line operation, the modem can be commanded by the &Rn command to ignore -RTS or to respond to -RTS by turning on -CTS after the delay specified by Register S26.   |
| -RDL  | IA      | <b>Remote Digital Loop Select (EIA RL/CCITT CT140).</b> -RDL input low activates remote digital loop request. The loop is executed at the speed for which the modem is currently configured.   |
| -AL   | IA      | <b>Analog Loop (EIA LL/CCITT CT141).</b> -AL input low causes the modem to operate in the analog loop test mode.   |
| -DRSIN  | IA      | <b>Data Signaling Rate Select (EIA CI/CCITT CT111).</b> This signal, relevant only in Central Europe, applies only to V.22 bis and V.22 modes. -DRSIN ON (low) will result in a 2400 bps connection. -DRSIN OFF (high) will force a 1200 bps connection, or will result in a fallback from 2400 bps to 1200 bps if already on-line.  |

Table 9. MCU Signal Definitions (Cont'd)

| Label   | I/O Type | Signal Name/Description   |
|---|----------|---|
| <b>TELEPHONE LINE INTERFACE (WIRELINE OPERATION ONLY)</b> |          |   |
| -RLY1   | OA       | <b>Relay 1 Control (~OH).</b> When cellular interface is not selected (CELL/DAA = high), PE0 is assigned to the ~RLY1 output signal. The active low ~RLY1 output can be used to control the normally open off-hook relay. The ~PULSE function can alternatively be provided on this line in addition to the ~OH function for single ~OH/~PULSE relay application.   |
| -RLY2   | OA       | <b>Relay 2 Control (~PULSE).</b> When cellular interface is not selected (CELL/DAA = high), PE1 is assigned to the ~RLY2 output signal. The active low ~RLY2 output can be used to control the normally open pulse dial relay. The ~PULSE function can alternatively be provided on the ~RLY1 line in addition to the ~OH function for single ~OH/~PULSE relay application.                               |
| -RLY3   | OA       | <b>Relay 3 Control (~A/A1, ~MUTE).</b> The active low ~RLY3 output can be used to control the normally open key telephone hold indicator (A/A1) relay. In W-class, ~RLY3 output can be used to control the normally open mute relay.  |
| -RLY4   | OA       | <b>Relay 4 Control (~T/DRLY, ~EARTH).</b> The active low ~RLY4 output can be used to control the normally closed talk/data relay. In W-class, ~RLY4 output can be used to control the normally open earthing relay.   |
| LCS   | IA       | <b>Loop Current Sense.</b> LCS is an active high input that indicates a handset off-hook status.  |
| RINGD   | IA       | <b>Ring Frequency.</b> A high-going edge on the RINGD input initiates an internal ring frequency measurement. The RINGD input from an external ring detect circuit is monitored to determine when to wake up from sleep or stop mode. The RINGD input is typically connected to the output of an optoisolator or equivalent. The idle state (no ringing) output of the ring detect circuit should be low. |
| <b>CELLULAR PHONE INTERFACE (CELLULAR OPERATION ONLY)</b> |          |   |
| CTRL0   | OA       | <b>Cellular Control 0.</b> When cellular interface is selected (CELL/DAA = low), PE0 is assigned to the CTRL0 output signal. CTRL0 is defined by the cellular firmware driver.  |
| CTRL1   | OA       | <b>Cellular Control 1.</b> When cellular interface is selected (CELL/DAA = low), PE1 is assigned to the CTRL1 output signal. CTRL1 is defined by the cellular firmware driver.  |
| CELCLK  | IA       | <b>Cellular Clock.</b> When cellular interface is selected (CELL/DAA = low), PA4 is assigned to the CELCLK input signal. CELCLK is defined by the cellular firmware driver.   |
| CELDATA   | IA/OA    | <b>Cellular Data.</b> When cellular interface is selected (CELL/DAA = low), PE5 is assigned to the bidirectional CELDATA line. CELDATA is defined by the cellular firmware driver.  |
| CELBSY  | OA       | <b>Cellular Busy.</b> When cellular interface is selected (CELL/DAA = low), PE2 is assigned to the CELBSY output signal. CELBSY is defined by the cellular firmware driver.   |
| -CELBSY   | IA       | <b>Cellular Not Busy.</b> When cellular interface is selected (CELL/DAA = low), PA3 is assigned to the ~CELBSY input signal. ~CELBSY is defined by the cellular firmware driver.  |
| <b>STOP MODE CIRCUIT</b>                                  |          |   |
| -STPMODE  | IA       | <b>Stop Mode.</b> ~STPMODE low causes the modem to enter the stop mode immediately after terminating a line connection if connected, terminating any test in process, and allowing any data in the receive buffer to clear. ~STPMODE must be high before the modem can attain normal operation after power turn-on, reset, or wake-up from sleep or stop mode.  |

Table 10. MDP Signal Definitions

| Label  | IO Type | Signal/Definition   |
|--|---------|---|
| <b>COMMON SIGNALS TO PARALLEL AND SERIAL INTERFACE</b> |         |   |
| <b>OVERHEAD SIGNALS</b>                                |         |   |
| XTLI, XTLO   | I, O    | <b>Crystal In and Crystal Out.</b> Connect to an external crystal circuit consisting of a 35.2512 MHz crystal, three capacitors, a resistor, and an inductor; or connect to a square wave generator/sine wave oscillator.   |
| ~POR1, ~POR2   | IA      | <b>Power-On Reset.</b> ~POR1 and ~POR2 low hold the modem in the reset state. ~POR1 and ~POR2 must be low for at least 3 $\mu$ s. ~POR1 and ~POR2 going high initiates internal hardware normal operation (but not modem processing). For serial Interface, the ~POR inputs are typically connected to a reset circuit. For parallel Interface, the ~POR inputs are typically connected to the host bus RESET line through an inverter. |
| ~RESIN   | OA      | <b>Reset Input.</b> Connect ~RESIN to ~RESOUT.  |
| VC   | MI      | <b>Centerpoint Voltage.</b> Connect to analog ground through 10 $\mu$ F (polarized, + terminal to VC) and 0.1 $\mu$ F (ceramic) in parallel.  |
| VREF   | MI      | <b>Voltage Reference.</b> Connect to VC through 10 $\mu$ F (polarized, + terminal to VREF) and 0.1 $\mu$ F (ceramic) in parallel.   |
| VREG   | MI      | <b>Voltage Reference.</b> Can be left open. Connect to ground through 0.1 $\mu$ F for compatibility with future products.   |
| DETIN  | MI      | <b>Detected Level In.</b> Connect to DETOUT.  |
| VDDR   | MI      | <b>Digital Supply Voltage Regulated.</b> Connect to GND through 0.1 $\mu$ F capacitor.  |
| GND  | GND     | <b>Digital Ground.</b> Connect to ground.   |
| AGND   | GND     | <b>Analog Ground.</b> Connect to ground.  |
| VDD1, VDD2   | PWR     | <b>DSP Digital Supply Voltage.</b> Connect to VCC.  |
| DVDD   | PWR     | <b>IA Digital Circuits Power.</b> Connect to VCC.   |
| AVDD1  | PWR     | <b>IA Digital Supply Voltage 1.</b> Connect to VCC.   |
| AVDD2  | PWR     | <b>IA Digital Supply Voltage 2.</b> Connect to VCC through RC filter.   |
| VAAOUT   | MI      | <b>Analog Supply Voltage Output.</b> Connect to VAA1 and VAA2.  |
| VAA1, VAA2   | PWR     | <b>Analog Supply Voltage.</b> Connect to VAAOUT. Connect to analog ground through 10 $\mu$ F and 0.1 $\mu$ F capacitors in parallel.  |
| REGOUT   | MI      | <b>Regulator Out.</b> Connect to REGIN.   |
| REGIN  | MI      | <b>Regulator In.</b> Connect to REGOUT.   |
| CAPP   | MI      | <b>Capacitor Plus Connection.</b> Connect CAPP to the plus terminal of a 1 $\mu$ F capacitor.   |
| CAPN   | MI      | <b>Capacitor Negative Connection.</b> Connect CAPN to the negative terminal of a 1 $\mu$ F capacitor.   |
| <b>MCU INTERFACE</b>                                   |         |   |
| D0-D7  | IA/OB   | <b>Data Lines.</b> Connect to the MCU D0-D7, respectively.  |
| RS0-RS4  | IA      | <b>Register Select Lines.</b> Connect to the MCU A0-A4, respectively.   |
| ~CS  | IA      | <b>Chip Select.</b> Connect to MCU ~DPSEL output.   |
| ~READ  | IA      | <b>Read Enable.</b> Connect to MCU ~READ.   |
| ~WRITE   | IA      | <b>Write Enable.</b> Connect to MCU ~WRITE.   |
| IRQ  | OA      | <b>Interrupt Request.</b> Connect to MCU ~DPIRQ.  |
| ~RESOUT  | OA      | <b>Reset Output.</b> ~RESOUT going high indicates internal hardware normal operation has been attained and initiates internal modem processing. The MDP is ready to use 500 ms after the low-to-high transition of ~RESOUT. Connect to the MCU ~RES pin.  |
| DETOUT   | OA      | <b>Detected Level Out.</b> DETOUT indicates the supply voltage level (high = 5V; low = 3.3V). Connect to DETIN and to the MCU PSC pin.  |

Table 10. MDP Signal Definitions (Cont'd)

| Label  | I/O Type | Signal Name/Description   |
|--|----------|---|
| <b>COMMON TELEPHONE LINE AND CELLULAR PHONE SIGNALS</b>  |          |   |
| TXA1, TXA2   | O(DF)    | <b>Transmit Analog 1 and 2.</b> The TXA1 and TXA2 outputs are differential outputs 180 degrees out of phase with each other. Each output can drive a 300 $\Omega$ load.   |
| RIN  | I(DA)    | <b>Receive Analog.</b> RIN is a single-ended receive data input from the telephone line interface or an optional external hybrid circuit.   |
| <b>TELEPHONE LINE INTERFACE ONLY SIGNALS</b>   |          |   |
| RINGD  | IA       | <b>Ring Detect.</b> The RINGD input is monitored for pulses in the range of 15 Hz to 68 Hz. The frequency detection range may be changed by the host in DSP RAM. The circuit driving RINGD should be a 4N35 optoisolator or equivalent. The circuit driving RINGD should not respond to momentary bursts of ringing less than 125 ms in duration, or less than 40 VRMS (15 Hz to 68 Hz) across TIP and RING. Detected ring signals are reflected on the $\sim$ RI output signal as well as the RI bit.  |
| $\sim$ RLYA<br>( $\sim$ OHRC)  | OD       | <b>Relay A Control.</b> The MDP $\sim$ RLYA output is connected to the normally closed Caller ID relay (DPDT). When Caller ID is enabled, the modem will assert this output to open the Caller ID relay and close the off-hook relay in order to detect Caller ID information between the first and second rings.<br><br>The $\sim$ RLYA output can each directly drive a +5V reed relay coil with a minimum resistance of 360 ohms and having a must-operate voltage of no greater than 4.0 Vdc. A clamp diode, such as a 1N4148, should be installed across the relay coil. An external transistor, such as an MPSA20, can be used to drive heavier loads (e.g., electro-mechanical relays). $\sim$ RLYA is controlled by host setting/resetting of the RA bit.         |
| $\sim$ RLYB<br>( $\sim$ TALK)  | OD       | <b>Relay B Control.</b> The MDP $\sim$ RLYB output is connected to the normally open Voice relay (DPDT). In voice mode, $\sim$ VOICE active closes the relay to switch the handset from the telephone line to a current source to power the handset so it can be used as a microphone and speaker interface to the modem.<br><br>The $\sim$ RLYB output can each directly drive a +5V reed relay coil with a minimum resistance of 360 ohms and having a must-operate voltage of no greater than 4.0 Vdc. A clamp diode, such as a 1N4148, should be installed across the relay coil. An external transistor, such as an MPSA20, can be used to drive heavier loads (e.g., electro-mechanical relays). $\sim$ RLYB is controlled by host setting/resetting of the RB bit. |
| <b>SPEAKER INTERFACE</b>   |          |   |
| SPKR   | O(DF)    | <b>Speaker Analog Output.</b> The SPKR output reflects the received analog input signal. The SPKR is controlled by the ATMn command. The SPKR output can drive an impedance as low as 300 ohms. In a typical application, the SPKR output is an input to an external LM386 audio power amplifier.   |
| <b>DIAGNOSTIC SIGNALS</b>  |          |   |
| Three signals provide the timing and data necessary to create an oscilloscope quadrature eye pattern. The eye pattern is simply a display of the received baseband constellation. By observing this constellation, common line disturbances can usually be identified. |          |   |
| EYEXY  | OA       | <b>Serial Eye Pattern X/Y Output.</b> EYEXY is a serial output containing two 15-bit diagnostic words (EYEX and EYEXY) for display on the oscilloscope X axis (EYEX) and Y axis (EYEXY). EYEX is the first word clocked out; EYEXY follows. Each word has 8-bits of significance. Each 15-bit data word is shifted out most significant bit first with the seven most significant bits set to zero. EYEXY is clocked by the rising edge of /EYECLK. This serial digital data must be converted to parallel digital form by a serial-to-parallel converter, and then to analog form by two digital-to-analog (D/A) converters.   |
| $\sim$ EYECLK  | OA       | <b>Serial Eye Pattern Clock.</b> $\sim$ EYECLK is a 288 kHz output clock for use by the serial-to-parallel converters. The low-to-high transitions of $\sim$ RDCLK coincide with the low-to-high transitions of $\sim$ EYECLK. $\sim$ EYECLK, therefore, can be used as a receiver multiplexer clock.   |
| EYESYNC  | OA       | <b>Serial Eye Pattern Strobe.</b> EYESYNC is a strobe for loading the D/A converters.   |

Table 10. MDP Signal Definitions (Cont'd)

| Label                                       | I/O Type | Signal Name/Description  |
|---|----------|--|
| <b>SERIAL INTERFACE VERSION</b>             |          |  |
| <b>DTE SERIAL/CONTROL/INDICATOR SIGNALS</b> |          |  |
| TXD   | IA       | <b>Transmitted Data.</b> The MDP obtains serial data to be transmitted from the DTE on the TXD input.  |
| RXD   | OA       | <b>Received Data.</b> The MDP presents received serial data to the DTE on the RXD output. RXD is also connected to the MCU DPRXD input.  |
| TDCLK                                       | OA       | <b>Transmit Data Clock.</b> The modem outputs a synchronous Transmit Data Clock (TDCLK) for USRT timing. The TDCLK frequency is the data rate ( $\pm 0.01\%$ ) with a duty cycle of $50 \pm 1\%$ .                 |
| XTCLK                                       | IA       | <b>External Transmit Clock.</b> In synchronous communication, an external transmit data clock can be connected to the MDP XTCLK input. The clock supplied at XTCLK must exhibit the same characteristics as TDCLK. |
| -RLSD                                       | OA       | <b>Received Line Signal Detector.</b> -RLSD active indicates that energy above the receive level threshold is present on the receiver input, and that the energy is not a training sequence.                       |
| -RDCLK                                      | OA       | <b>Receive Data Clock.</b> The modem outputs a synchronous Receive Data Clock (-RDCLK) for USRT timing.  |
| -RTS  | IA       | <b>Request to Send.</b> Not used; pull up to VCC through 10k $\Omega$ .  |
| -DTR  | IA       | <b>Data Terminal Ready.</b> Not used; pull up to VCC through 10k $\Omega$ .  |
| -CTS  | OA       | <b>Clear to Send.</b> Not used; leave open.  |
| -DSR  | OA       | <b>Data Set Ready.</b> Not used; leave open.   |

## SCHEMATICS

Typical interface schematics for the MCU with parallel host interface and with serial DTE interface are shown in Figures 8 and 9, respectively.

Typical interface schematics for the MDP are shown in Figures 10.

A schematic for a typical line interface circuit is shown in Figure 11.

Figure 12 is a schematic of a typical external hybrid circuit.

A schematic for a typical speaker circuit connected to the MDP SPKR output is shown in Figure 13.

Consult the AccelerATor Kits for full schematics of typical applications.
