

Features

- Wide Power Supply Range, 3.0 V to 5.5 V
- Fast Read Access Time - 120 ns
- Compatible with JEDEC Standard AT27C512R
- Low Power 3.3-Volt CMOS Operation
 - 20 μ A max. Standby
 - 29 mW max. Active at 5 MHz for $V_{CC} = 3.6$ V
 - 110 mW max. Active at 5 MHz for $V_{CC} = 5.5$ V
- Wide Selection of JEDEC Standard Packages
 - 28-Lead 600-mil PDIP and Cerdip
 - 32-Pad PLCC and LCC
 - 28-Lead TSOP and SOIC
- High Reliability CMOS Technology
 - 2000 V ESD Protection
 - 200 mA Latchup Immunity
- Rapid Programming - 100 μ s/byte (typical)
- Two-line Control
- CMOS and TTL Compatible Inputs and Outputs
- Integrated Product Identification Code
- Commercial and Industrial Temperature Ranges

Description

The AT27LV512R chip is a low power, low voltage 524,288 bit ultraviolet erasable and electrically programmable read only memory (EPROM) organized as 64K x 8 bits. It requires only one supply in the range of 3.0 to 5.5 V in normal read mode operation, making it ideal for portable systems.

With a typical power draw of only 10 mW at 1 MHz and V_{CC} at 3.3 V, the AT27LV512R draws less than one-fifth the power of a standard 5-V EPROM. Standby mode supply current is typically less than 1 μ A at 3.3 V.

Description (Continued)

The AT27LV512R comes in a choice of industry standard JEDEC-approved packages, including: one-time programmable (OTP) plastic PDIP, PLCC, SOIC, and TSOP, as well as windowed ceramic Cerdip and LCC. All devices feature two-line control ($\overline{CE}$, $\overline{OE}$) to give designers the flexibility to prevent bus contention.

The AT27LV512R operating with V_{CC} at 3.0 V produces TTL level outputs that are compatible with standard TTL logic devices operating at $V_{CC} = 5.0$ V.

Atmel's 27LV512R has additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μ s/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27LV512R programs identically as an AT27C512R.

Erase Characteristics

The entire memory array of the AT27LV512R is erased (all outputs read as V_{OH}) after exposure to ultraviolet light at a wavelength of 2537 Å. Complete erasure is assured after a minimum of 20 minutes exposure using 12,000 μ W/cm² intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from the minimum integrated erasure dose of 15 W-sec/cm². To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable EPROM which will be subjected to continuous fluorescent indoor lighting or sunlight.

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

1. Minimum voltage is -0.6 V dc which may undershoot to -2.0 V for pulses of less than 20 ns. Maximum output pin voltage is $V_{CC} + 0.75$ V dc which may be exceeded if certain precautions are observed (consult application notes) and which may overshoot to +7.0 V for pulses of less than 20 ns.

1. X can be V_{IL} or V_{IH} .
 2. Refer to Programming characteristics. Programming modes require $V_{CC} > 4.5$ V.
 3. $V_{IH} = 12.0 \pm 0.5$ V.

4. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_{IH} and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

Manufacturer	0	0	0	0	1	1	1	1	0	1E
Device Type	1	0	0	0	0	1	1	0	1	0D

Note: 1. The AT27LV512R has the same Product Identification Code as the AT27C512R. Both are programming compatible.

Rapid Programming Algorithm

A 100 μs $\overline{\text{CE}}$ pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5 V and $\overline{\text{OE}}/V_{PP}$ is raised to 13.0 V. Each address is first programmed with one 100 μs $\overline{\text{CE}}$ pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 μs pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. $\overline{\text{OE}}/V_{PP}$ is then lowered to V_{IL} and V_{CC} to 5.0 V. All bytes are read again and compared with the original data to determine if the device passes or fails.
