

Features

- Fast Read Access Time - 100 ns
- Low Power CMOS Operation
 - 100 μ A max. Standby
 - 25 mA max. Active at 5 MHz (AT27C010L)
 - 40 mA max. Active at 5 MHz (AT27C010)
- Wide Selection of JEDEC Standard Packages Including OTP
 - 32-Lead 600-mil Cerdip and OTP Plastic DIP, SOIC or TSOP
 - 32-Pad LCC, 32-Lead JLCC and OTP PLCC
- 5 V $\pm$ 10% Supply
- High Reliability CMOS Technology
 - 2000 V ESD Protection
 - 200 mA Latchup Immunity
- Rapid Programming - 100 μ s/byte (typical)
- Two-line Control
- CMOS and TTL Compatible Inputs and Outputs
- Integrated Product Identification Code
- Full Military, Commercial and Industrial Temperature Ranges

Description

The AT27C010/L chip family is a low-power, high performance 1,048,576 bit Ultraviolet Erasable and Electrically Programmable Read Only Memory (EPROM) organized as 128K x 8 bits. They require only one 5 V power supply in normal read mode operation. Any byte can be accessed in less than 100 ns, eliminating the need for speed reducing WAIT states on high performance microprocessor systems.

Two power versions are offered. In read mode, the AT27C010 typically consumes 25 mA while the AT27C010L takes only 8 mA. Standby mode supply current for both parts is typically less than 10 μ A.

Description (Continued)

The AT27C010/L comes in a choice of industry standard JEDEC-approved packages including; 32-pin ceramic DIP; 32-pad ceramic leadless chip carrier (LCC); 32-lead ceramic J-leaded chip carrier (JLCC); 32-lead one time programmable (OTP) plastic J-leaded chip carrier (PLCC); 32-pin OTP plastic gull wing small outline IC (SOIC); and 32-pin OTP thin small outline package (TSOP). All devices feature two line control ($\overline{CE}$, $\overline{OE}$) to give designers the flexibility to prevent bus contention.

With high density 128K byte storage capability, the AT27C010/L allow firmware to be stored reliably and to be accessed by the system without the delays of mass storage media.

Atmel's 27C010/L have additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 μ s/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages.

Erase Characteristics

The entire memory array of the AT27C010/L is erased (all outputs read as V_{OH}) after exposure to ultraviolet light at a wavelength of 2537Å. Complete erasure is assured after a minimum of 20 minutes exposure using 12,000 μ W/cm² intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from the minimum integrated erasure dose of 15W-sec/cm². To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable EPROM which will be subjected to continuous fluorescent indoor lighting or sunlight.

Storage Temperature	-65°C to +150°C
Voltage on Any Pin with Respect to Ground	-2.0 V to +7.0 V ⁽¹⁾
Voltage on A9 with Respect to Ground	-2.0 V to +14.0 V ⁽¹⁾
VPP Supply Voltage with Respect to Ground	-2.0 V to +14.0 V ⁽¹⁾
Integrated UV Erase Dose	7258 W-sec/cm ²

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

1. Minimum voltage is -0.6 V dc which may undershoot to -2.0 V for pulses of less than 20 ns. Maximum output pin voltage is $V_{CC} + 0.75$ V dc which may overshoot to +7.0 V for pulses of less than 20 ns.

Notes:

1. Timing measurement references are 0.8 V and 2.0 V. Input AC driving levels are 0.45 V and 2.4 V, unless otherwise specified.
2. $\overline{OE}$ may be delayed up to $t_{CE}-t_{OE}$ after the falling edge of $\overline{CE}$ without impact on t_{CE} .
3. $\overline{OE}$ may be delayed up to $t_{ACC}-t_{OE}$ after the address is valid without impact on t_{ACC} .
4. This parameter is only sampled and is not 100% tested.
5. Output float is defined as the point when data is no longer driven.

Rapid Programming Algorithm

A $100\text{ }\mu\text{s}$ PGM pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5 V and V_{PP} is raised to 13.0 V. Each address is first programmed with one $100\text{ }\mu\text{s}$ PGM pulse without verification. Then a verification / reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive $100\text{ }\mu\text{s}$ pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0 V and V_{CC} to 5.0 V. All bytes are read again and compared with the original data to determine if the device passes or fails.
