### DESCRIPTION

The QB00FM relay is an advanced solid state bi-directional relay designed for high speed power switching applications. This relay utilizes state-of-the-art solid state circuit technology and manufacturing techniques to provide high reliability, low life cycle cost and exceptional switch performance.

The QB00FM is capable of switching AC or DC power. The three output terminals can be configured for DC switching with ON resistance reduced to 25 milliohms and a current rating of 10 A continuous.

Other features include optical coupling to minimize EMI generation and to protect logic circuits from output voltage transients.

The QB00FM is packaged in a hermetically sealed low profile package suitable for heat sink or circuit card mounting. Pin 6 is connected to the case for additional safety shielding.

**NOTES:**

1. For input voltages above 6V, a series resistor is required. Use the standard resistor value equal to or less than the value found in Figure 6.  
$$(V_{input} - 6V) / 0.035A$$
  
The input voltage should never exceed 16 Vdc.
2. The rated input voltage is 5V for all tests unless otherwise specified.
3. Relays may drive loads connected to either positive or negative reference power supply lines. Inductive loads must be diode suppressed.
4. To calculate the maximum ON resistance for a given junction temperature, find the normalized ON resistance factor (NR) from Figure 4. Calculate the new ON resistance as follows:  
$$R_{(ON)} = NR \times R_{(ON)} @ 25^{\circ}C$$
5. Input transition should be  $\leq 1$  ms duration and input drive should be "bounceless contact" type.
6. Relays are tested in the bi-directional configuration only. DC parameters are shown for reference only.
