Terminal Voltages $\pm 5 \mathrm{~V}$, 32 Taps

## X9313

## Digitally Controlled Potentiometer (XDCP ${ }^{\text {TM }}$ )

## FEATURES

- Solid-state potentiometer
- 3-wire serial interface
- 32 wiper tap points
-Wiper position stored in nonvolatile memory and recalled on power-up
- 31 resistive elements
-Temperature compensated
-End to end resistance range $\pm 20 \%$
-Terminal voltages, -5 V to +5 V
- Low power CMOS
$-\mathrm{V}_{\mathrm{Cc}}=3 \mathrm{~V}$ or 5 V
-Active current, 3mA max.
-Standby current, $500 \mu \mathrm{~A}$ max.
- High reliability
-Endurance, 100,000 data changes per bit
-Register data retention, 100 years
- $\mathrm{R}_{\text {TOTAL }}$ values $=1 \mathrm{~K} \Omega, 10 \mathrm{~K} \Omega, 50 \mathrm{~K} \Omega, 100 \mathrm{~K} \Omega$
- Packages
-8-lead SOIC, MSOP and DIP

## DESCRIPTION

The Xicor X9313 is a digitally controlled potentiometer (XDCP). The device consists of a resistor array, wiper switches, a control section, and nonvolatile memory. The wiper position is controlled by a 3 -wire interface.

The potentiometer is implemented by a resistor array composed of 31 resistive elements and a wiper switching network. Between each element and at either end are tap points accessible to the wiper terminal. The position of the wiper element is controlled by the $\overline{\mathrm{CS}}, \mathrm{U} / \overline{\mathrm{D}}$, and $\overline{\mathrm{NC}}$ inputs. The position of the wiper can be stored in nonvolatile memory and then be recalled upon a subsequent power-up operation.

The device can be used as a three-terminal potentiometer or as a two-terminal variable resistor in a wide variety of applications including:

- control
- parameter adjustments
- signal processing

## BLOCK DIAGRAMS

Detailed

## PIN DESCRIPTIONS

$\mathbf{R}_{\mathrm{H}} / \mathbf{V}_{\mathbf{H}}$ and $\mathbf{R}_{\mathrm{L}} / \mathrm{V}_{\mathrm{L}}$
The high ( $\mathrm{R}_{\mathrm{H}} / \mathrm{V}_{\mathrm{H}}$ ) and low ( $\mathrm{R}_{\mathrm{L}} / \mathrm{V}_{\mathrm{L}}$ ) terminals of the X9313 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is $\mathrm{V}_{\mathrm{SS}}$ and the maximum is $\mathrm{V}_{\mathrm{CC}}$. The terminology of $\mathrm{R}_{\mathrm{L}}$ / $\mathrm{V}_{\mathrm{L}}$ and $\mathrm{R}_{\mathrm{H}} / \mathrm{V}_{\mathrm{H}}$ references the relative position of the terminal in relation to wiper movement direction selected by the U/D input and not the voltage potential on the terminal.
$\mathbf{R}_{\mathrm{w}} / \mathbf{V}_{\mathrm{w}}$
$\mathrm{R}_{\mathrm{W}} / \mathrm{V}_{\mathrm{w}}$ is the wiper terminal and is equivalent to the movable terminal of a mechanical potentiometer. The position of the wiper within the array is determined by the control inputs. The wiper terminal series resistance is typically $40 \Omega$ at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}$.

## Up/Down (U/ $\overline{\mathbf{D}}$ )

The $U / \bar{D}$ input controls the direction of the wiper movement and whether the counter is incremented or decremented.

## Increment (INC)

The INC input is negative-edge triggered. Toggling INC will move the wiper and either increment or decrement the counter in the direction indicated by the logic level on the $U / \bar{D}$ input.

## Chip Select ( $\overline{\mathbf{C S}}$ )

The device is selected when the $\overline{C S}$ input is LOW. The current counter value is stored in nonvolatile memory when $\overline{\mathrm{CS}}$ is returned HIGH while the $\overline{\mathrm{INC}}$ input is also HIGH. After the store operation is complete the X9313 will be placed in the low power standby mode until the device is selected once again.

## PIN CONFIGURATION

PIN NAMES

| Symbol | Description |
| :---: | :--- |
| $\mathrm{R}_{\mathrm{H}} / \mathrm{V}_{\mathrm{H}}$ | High terminal |
| $\mathrm{R}_{\mathrm{W}} / \mathrm{V}_{\mathrm{W}}$ | Wiper terminal |
| $\mathrm{R}_{\mathrm{L}} / \mathrm{V}_{\mathrm{L}}$ | Low terminal |
| $\mathrm{V}_{\mathrm{SS}}$ | Ground |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply voltage |
| $\mathrm{U} / \overline{\mathrm{D}}$ | Up/Down control input |
| $\overline{\mathrm{INC}}$ | Increment control input |
| $\overline{\mathrm{CS}}$ | Chip Select control input |

## PRINCIPLES OF OPERATION

There are three sections of the X9313: the input control, counter and decode section; the nonvolatile memory; and the resistor array. The input control section operates just like an up/down counter. The output of this counter is decoded to turn on a single electronic switch connecting a point on the resistor array to the wiper output. Under the proper conditions the contents of the counter can be stored in nonvolatile memory and retained for future use. The resistor array is comprised of 31 individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. That is, the counter does not wrap around when clocked to either extreme.

The electronic switches on the device operate in a "make before break" mode when the wiper changes tap positions. If the wiper is moved several positions, multiple taps are connected to the wiper for tiw (INC to $\mathrm{V}_{\mathrm{W}}$ change). The $\mathrm{R}_{\mathrm{TOTAL}}$ value for the device can temporarily be reduced by a significant amount if the wiper is moved several positions.

When the device is powered-down, the last wiper position stored will be maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the wiper is set to the value last stored.

## INSTRUCTIONS AND PROGRAMMING

The $\overline{\mathrm{NC}}, \mathrm{U} / \overline{\mathrm{D}}$ and $\overline{\mathrm{CS}}$ inputs control the movement of the wiper along the resistor array. With $\overline{\mathrm{CS}}$ set LOW the device is selected and enabled to respond to the $\mathrm{U} / \overline{\mathrm{D}}$ and $\overline{\mathrm{INC}}$ inputs. HIGH to LOW transitions on INC will increment or decrement (depending on the state of the $U / \bar{D}$ input) a seven bit counter. The output of this counter is decoded to select one of thirty two wiper positions along the resistive array.

The value of the counter is stored in nonvolatile memory whenever CS transitions HIGH while the INC input is also HIGH.

The system may select the X9313, move the wiper and deselect the device without having to store the latest wiper position in nonvolatile memory. After the wiper movement is performed as described above and once the new position is reached, the system must keep INC LOW while taking CS HIGH. The new wiper position will be maintained until changed by the system or until a power-up/down cycle recalled the previously stored data.
This procedure allows the system to always power-up to a preset value stored in nonvolatile memory; then during system operation minor adjustments could be made. The adjustments might be based on user preference, system parameter changes due to temperature drift, etc...

The state of $U / \bar{D}$ may be changed while $\overline{C S}$ remains LOW. This allows the host system to enable the device and then move the wiper up and down until the proper trim is attained.

## MODE SELECTION

| CS | INC | U/D | Mode |
| :---: | :---: | :---: | :---: |
| L | 1 | H | Wiper Up |
| L | 1 | L | Wiper Down |
| $-7$ | H | X | Store Wiper Position |
| H | X | X | Standby Current |
| $\rightarrow$ | L | X | No Store, Return to Standby |

## SYMBOL TABLE

## COMMENT

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only; functional operation of the device (at these or any other conditions above those listed in the operational sections of this specification) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## RECOMMENDED OPERATING CONDITIONS

| Temperature | Min. | Max. |
| :---: | :---: | :---: |

## POWER UP AND DOWN REQUIREMENTS

There are no restrictions on the sequencing of $\mathrm{V}_{\mathrm{CC}}$ and the voltages applied to the potentiometer pins during power-up or power-down conditions. During power-up, the data sheet parameters for the DCP do not fully apply until 1 millisecond after $\mathrm{V}_{\mathrm{CC}}$ reaches is final value. The $\mathrm{V}_{\mathrm{CC}}$ ramp spec is always in effect.
A.C. TIMING

Notes: (6) Typical values are for $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ and nominal supply voltage.
(7) This parameter is not $100 \%$ tested.
(8) MI in the $\mathrm{A} . \mathrm{C}$. timing diagram refers to the minimum incremental change in the $\mathrm{V}_{\mathrm{W}}$ output due to a change in the wiper position.

## APPLICATIONS INFORMATION

Electronic digitally controlled (XDCP) potentiometers provide three powerful application advantages; (1) the variability and reliability of a solid-state potentiometer, (2) the flexibility of computer-based digital controls, and (3) the retentivity of nonvolatile memory used for the storage of multiple potentiometer settings or data.

## Basic Configurations of Electronic Potentiometers

Three terminal potentiometer; variable voltage divider

Two terminal variable resistor variable current

Foreign patents and additional patents pending.

## LIFE RELATED POLICY

In situations where semiconductor component failure may endanger life, system designers using this product should design the system with appropriate error detection and correction, redundancy and back-up features to prevent such an occurrence.
Xicor's products are not authorized for use in critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
