## 140 mW Power Amplifier with T/R and Diversity Switches 2.4-2.5 GHz

## Features

- Highly Integrated PA/Attenuator and T/R Switch
- Low Current Consumption: 120 mA Typ.
- Switch and Attenuator Controls CMOS Compatible
- High Power ( 140 mW ) and Low Power ( 16 mW )

Transmit Power Control

- +5 V/-5 V Fixed Supply Voltages

## Description

M/A-COM's AM55-0001 is a GaAs power amplifier with integrated transmit/receive and an antenna diversity switch in a low cost SSOP 24 plastic package. The AM55-0001 employs active bias circuits that eliminate the need for external bias adjustment. A 'Sleep Mode' is incorporated which turns off current draw from the positive supply of the PA during receive mode. The AM55-0001 provides a $10-\mathrm{dB}$ step attenuator for use as a transmit power controller.

The AM55-0001 is designed for low power consumption and is ideally suited for FSK systems in the $2.4-2.5 \mathrm{GHz}$ bands (North American ISM, Japanese RCR. 32 and European ETSI). Typical applications include WLAN and wireless portable data collection.

This amplifier is also available without diversity switching (AM55-0007). Either power amplifier can be combined with a transceiver IC (MD58-0001) to form a complete RF front end.

M/A-COM's AM55-0001 is fabricated using a mature 0.5 -micron gate length GaAs process. The process features full passivation for increased performance and reliability.

1. Exceeding these limits may cause permanent damage.
2. Ambient temperature $\left(\mathrm{T}_{\mathrm{A}}\right)=+25^{\circ} \mathrm{C}$
3. $\left|\mathrm{V}_{\mathrm{DD}}\right|+\left|\mathrm{V}_{\mathrm{GG}}\right|$ not to exceed 12 volts.

## Pin Configuration

| Pin No. | Pin Name | Description |
| :---: | :---: | :---: |
| 1 | $\mathrm{V}_{\mathrm{GG}}$ | Negative voltage to all active bias networks |
| 2 | T/R CTRL | 0 V for transmit mode, +5 V for receive mode |
| 3 | Rx OUT | Output of T/R switch for receive mode |
| 4 | GND | DC and RF Ground |
| 5 | PA OUT | Output of T/R switch for transmit mode |
| 6 | $V_{D D} \mathrm{PA}$ | $\mathrm{V}_{\mathrm{DD}}$ for output stage of $\mathrm{PA}, \mathrm{V}_{\mathrm{DD}}$ for active bias circuit of output stage |
| 7 | GND | DC and RF Ground |
| 8 | ATTN CTRL | 0 V for high power mode, +5 V for low power mode |
| 9 | GND | DC and RF Ground |
| 10 | ANT COMMON | Common port of diversity switch |
| 11 | GND | DC and RF Ground |

| 14 | GND | DC and RF Ground |
| 15 | ANT CTRL | 0 V for ANT Common to ANT 1, +5 V for ANT Common to ANT 2 |
| 16 | GND | DC and RF Ground |
| 17 | $\mathrm{V}_{\mathrm{DD} 2}$ | $V_{D D}$ for both diversity and T/R switches, $\mathrm{V}_{\mathrm{DD}}$ for second stage of PA |
| 18 | GND | DC and RF Ground |
| 19 | $\mathrm{V}_{\mathrm{DD} 1}$ | $V_{D D}$ for first stage of PA, $V_{D D}$ of active bias for the first and second stage of PA |
| 20 | GND | DC and RF Ground |
| 21 | GND | DC and RF Ground |
| 22 | PA IN | RF input to PA |
| 23 | GND | DC and RF Ground |
| 24 | SLEEP CTRL | 0 V PA "on" mode, -5 V PA "sleep" mode. Sleep mode shuts off active bias and "pinches off" all PA FETs. |

## Recommended PCB Configuration

External Circuitry Parts List

| Label | Value | Purpose |
| :---: | :---: | :---: |
| $\mathrm{C} 1-\mathrm{C} 4$ | 33 pF | Bypass $(\mathrm{GHz})$ |
| $\mathrm{C} 5-\mathrm{C} 8$ | 1000 pF | Bypass $(\mathrm{MHz})$ |
| C 9 | $0.01 \mu \mathrm{~F}$ | Bypass $(\mathrm{kHz})$ |

All off-chip components are low-cost surface mount components obtainable from multiple sources. ( $0.020 \mathrm{in} . \times 0.040 \mathrm{in}$. or 0.030 in . $x 0.050 \mathrm{in}$.)

## Cross-Section View

The PCB dielectric between RF traces and RF ground layers should be chosen to reduce RF discontinuities between $5 \theta \Omega$ lines and package pins. M/A-COM recommends an FR- 4 dielectric thickness of 0.008 in. $(0.2 \mathrm{~mm})$, yielding a $50 \Omega$ line width of 0.015 in . $(0.38 \mathrm{~mm})$. The recommended metalization thickness is 1 oz copper.
Shaded traces are vias to DC routing layer and traces on DC routing layer.

## Biasing Procedure

The AM55-0001 requires the $\mathrm{V}_{\mathrm{GG}}$ bias be applied prior to $\boldsymbol{a} \boldsymbol{y} \boldsymbol{y} \mathrm{V}_{\mathrm{DD}}$ bias. Permanent damage may occur if this procedure is not followed. All FETs in the PA will draw excessive current and damage internal circuitry.

## Designer's Kit (AM55-0001SMB)

The AM55-0001SMB Designer's Kit allows for immediate evaluation of M/A-COM's AM55-0001 integrated Power Amplifier with T/R and Diversity Switch. The evaluation board consists of an AM55-0001, recommended external surface mount circuitry, RF connectors and a DC multi-pin connector, all mounted to a multi-layer FR- 4 PCB. Other items included in the Designer's Kit: a floppy disk (with typical performance data and a .DXF file of the recommended PCB layout) and any additional Application Notes. The AM55-0001SMB evaluation PCB and block diagram are illustrated below with all functional ports labeled.

## AM55-0001SMB Biasing Procedure

In order to prevent transients which may damage the MMIC, please adhere to the following procedure.

- Turn on all power supplies and set all voltages to 0 volts BEFORE connecting the power supplies to the DC connector.
- Set jumpers for desired test mode.
- Apply a -5.0 volt supply to DC connector pin $20\left(\mathrm{~V}_{\mathrm{GG}}\right)$.
- Apply a +5.0 volt supply to the DC connector pin $1\left(\mathrm{~V}_{\mathrm{DD} 1}\right)$.
- Apply a +5.0 volt supply to the DC connector pin $2\left(\mathrm{~V}_{\mathrm{DD} 2}\right)$.
- Apply a +5.0 volt supply to the DC connector pin 19 ( $V_{D D} P A$ ).
- Adjust $\mathrm{V}_{\mathrm{GG}}$ supply to -5 volts.
- Adjust all $\mathrm{V}_{\mathrm{DD}}$ supplies to +5 volts.
- Hot switching of jumpers will not damage device.
- To power off, reverse above procedure.

1. Set $V_{D D 1} \& V_{D D 2} \& V_{D D}$ PA to 0 volts.
2. Set $\mathrm{V}_{\mathrm{GG}}$ to 0 volts.
3. Disconnect bias lines from DC connector.
4. Turn off power supplies.

Evaluation PCB and RF Connector Losses

The DC connector on the Designer's Kit PCB allows selection of all the device's operating modes. It is accomplished by one or more of the following methods:

1. A mating female multi-pin connector (Newark Electronics Stock \# 46F-4658, not included)
2. Wires soldered to the necessary pins (not included)
3. Clip leads (not included)
4. A combination of clip leads or wires and jumpers (jumpers included as required)
