

Am29821A - Am29826A

High-Performance Bus Interface Registers

PRELIMINARY

DISTINCTIVE CHARACTERISTICS

- High-speed parallel positive edge-triggered registers with D-type flip-flops
 - Noninverting CP-Y $t_{PD} = 6$ ns typical
 - Inverting CP-Y $t_{PD} = 6$ ns typical
- Buffered common Clock Enable ($\overline{EN}$) and asynchronous Clear input ($\overline{CLR}$)
- Three-state outputs glitch free during power-up and down. Outputs have Schottky clamp to ground
- I_{OL} : 48 mA Commercial, 32 mA Military
- Metastable "Hardened" Registers
- Higher speed, lower power versions of the Am29821 - 826.

GENERAL DESCRIPTION

The Am29821A - 826A Series Bus Interface Registers are designed to eliminate the extra packages required to buffer existing registers, and provide extra data width for wider address/data paths or buses carrying parity. The Am29821A and Am29822A are buffered, 10-bit wide versions of the popular '374/'534 functions. The Am29823A and Am29824A are 9-bit wide buffered registers with Clock Enable ($\overline{EN}$) and Clear ($\overline{CLR}$) - ideal for parity bus

interfacing in high-performance microprogrammed systems. The Am29825A and Am29826A are 8-bit buffered registers with all the 9-bit controls plus multiple enables ($\overline{OE}_1, \overline{OE}_2, \overline{OE}_3$) to allow multiuser control of the interface, e.g., $\overline{CS}$, DMA, and RD/WR. They are ideal for use as an output port requiring high I_{OL}/I_{OH} .

All of the Am29800A high-performance interface family are designed for high-capacitance load drive capability.

PIN DESCRIPTION

D_i Data Input (Input)

D_i are the flip-flop data inputs.

Y_i Data Outputs (Output)

Y_i are the three-state data outputs.

CP Clock Pulse (Input, LOW-to-HIGH Transition)

Clock Pulse is the clock input for the registers. Data is entered into the registers on LOW-to-HIGH transitions.

Am29821A/Am29822A Only

$\overline{OE}$ Output Enable (Input, Active LOW)

When the $\overline{OE}$ input is HIGH, the Y_i outputs are in the high-impedance state. When $\overline{OE}$ is LOW, the register data is transferred to the Y_i outputs.

Am29823A/Am29824A Only

$\overline{EN}$ Clock Enable (Input, Active LOW)

When the $\overline{EN}$ input is LOW, data on the D_i inputs are transferred to the $\overline{Q}_i$ outputs on the LOW-to-HIGH clock transition. When $\overline{EN}$ is HIGH, the $\overline{Q}_i$ outputs do not change state, regardless of data or clock input transitions.

$\overline{CLR}$ Clear (Input, Active LOW)

When the $\overline{CLR}$ input is LOW and $\overline{OE}$ is LOW, the Y_i outputs

are LOW. When $\overline{CLR}$ is HIGH, data can be entered into the register.

$\overline{OE}$ Output Enable (Input, Active LOW)

When the $\overline{OE}$ input is HIGH, the Y_i outputs are put in the high-impedance state. When $\overline{OE}$ is LOW, the register data is passed to the Y_i outputs.

Am29825A/Am29826A Only

$\overline{EN}$ Clock Enable (Input, Active LOW)

When the $\overline{EN}$ input is LOW, data on the D_i inputs are transferred to the $\overline{Q}_i$ outputs on the LOW-to-HIGH clock transition. When $\overline{EN}$ is HIGH, the $\overline{Q}_i$ outputs do not change state, regardless of data or clock input transitions.

$\overline{CLR}$ Clear (Input, Active LOW)

When the $\overline{CLR}$ input is LOW and all $\overline{OE}_i$ inputs are LOW, the Y_i outputs are LOW. When $\overline{CLR}$ is HIGH, data can be entered into the register.

$\overline{OE}$ Output Enables (Input, Active LOW)

When $\overline{OE}_1$, $\overline{OE}_2$, and $\overline{OE}_3$ are all LOW, register data is passed to the Y_i outputs. If any or all $\overline{OE}_i$ are HIGH, the Y_i outputs are put in a high-impedance state.

ABSOLUTE MAXIMUM RATINGS

Storage Temperature -65 to +150°C
 Ambient Temperature with
 Power Applied -55 to +125°C
 Supply Voltage to Ground Potential
 Continuous -0.5 V to +7.0 V
 DC Voltage Applied to Outputs
 for High Output State -0.5 V to 5.5 V
 DC Input Voltage -0.5 V to +5.5 V
 DC Output Current, into Outputs 100 mA
 DC Input Current -30 mA to +5.0 mA

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

OPERATING RANGES

Commercial (C) Devices
 Temperature, T_A 0 to +70°C
 Supply Voltage +4.5 V to +5.5 V
 Military (M) Devices
 Temperature, T_C -55 to +125°C
 Supply Voltage +4.5 V to +5.5 V

Operating ranges define those limits over which the functionality of the device is guaranteed.
