### GENERAL DESCRIPTION

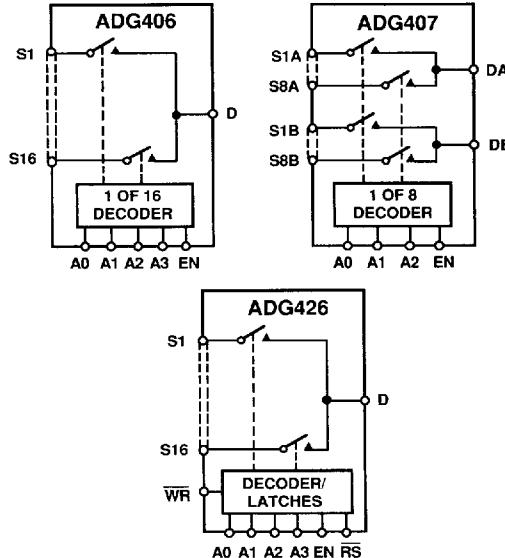

The ADG406, ADG407 and ADG426 are monolithic CMOS analog multiplexers. The ADG406 and ADG426 switch one of sixteen inputs to a common output as determined by the 4-bit binary address lines A0, A1, A2 and A3. The ADG426 has on-chip address and control latches that facilitate microprocessor interfacing. The ADG407 switches one of eight differential inputs to a common differential output as determined by the 3-bit binary address lines A0, A1 and A2. An EN input on all devices is used to enable or disable the device. When disabled, all channels are switched OFF.

The ADG406/ADG407/ADG426 are designed on an enhanced LC<sup>2</sup>MOS process that provides low power dissipation yet gives high switching speed and low on resistance. These features make the parts suitable for high speed data acquisition systems and audio signal switching. Low power dissipation makes the parts suitable for battery powered systems. Each channel conducts equally well in both directions when ON and has an input signal range which extends to the supplies. In the OFF condition, signal levels up to the supplies are blocked. All channels exhibit break before make switching action preventing momentary shorting when switching channels. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

### PRODUCT HIGHLIGHTS

1. Extended Signal Range.
2. Low Power Dissipation
3. Low R<sub>ON</sub>
4. Single/Dual Supply Operation
5. Single Supply Operation

For applications where the analog signal is unipolar, the ADG406/ADG407/ADG426 can be operated from a single rail power supply. The parts are fully specified with a single +12 V power supply and will remain functional with single supplies as low as +5 V.

### NOTES

<sup>1</sup>Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

<sup>2</sup>Overvoltages at A, S, D, WR or RS will be clamped by internal diodes. Current should be limited to the maximum ratings given.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although these devices feature proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## TIMING DIAGRAMS (ADG426)

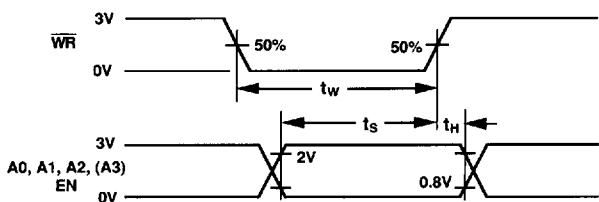

Figure 1.

Figure 1 shows the timing sequence for latching the switch address and enable inputs. The latches are level sensitive; therefore, while  $\overline{WR}$  is held low, the latches are transparent and the switches respond to the address and enable inputs. This input data is latched on the rising edge of  $\overline{WR}$ .

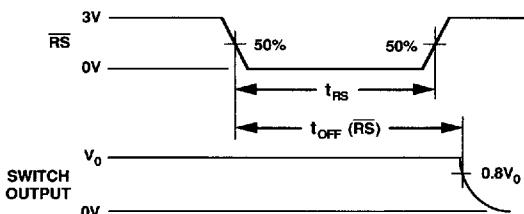

Figure 2.

Figure 2 shows the Reset Pulse Width,  $t_{RS}$ , and the Reset Turn Off Time,  $t_{OFF}(\overline{RS})$ .

Note: All digital input signals rise and fall times are measured from 10% to 90% of 3 V.  $t_R = t_F = 20$  ns.

## TERMINOLOGY

$V_{DD}$	Most positive power supply potential.
$V_{SS}$	Most negative power supply potential in dual supplies. In single supply applications, it may be connected to ground.
GND	Ground (0 V) reference.
$R_{ON}$	Ohmic resistance between D and S.
$R_{ON}$ Match	Difference between the $R_{ON}$ of any two channels.
$I_s$ (OFF)	Source leakage current when the switch is off.
$I_d$ (OFF)	Drain leakage current when the switch is off.
$I_d, I_s$ (ON)	Channel leakage current when the switch is on.
$V_D$ ( $V_S$ )	Analog voltage on terminals D, S.
$C_s$ (OFF)	Channel input capacitance for "OFF" condition.
$C_D$ (OFF)	Channel output capacitance for "OFF" condition.
$C_D, C_s$ (ON)	"ON" switch capacitance.
$C_{IN}$	Digital input capacitance.
$t_{ON}$ (EN)	Delay time between the 50% and 90% points of the digital input and switch "ON" condition.
$t_{OFF}$ (EN)	Delay time between the 50% and 90% points of the digital input and switch "OFF" condition.
$t_{TRANSITION}$	Delay time between the 50% and 90% points of the digital inputs and the switch "ON" condition when switching from one address state to another.
$t_{OPEN}$	"OFF" time measured between 80% points of both switches when switching from one address state to another.
$V_{INL}$	Maximum input voltage for logic "0."
$V_{INH}$	Minimum input voltage for logic "1."
$I_{INL}$ ( $I_{INH}$ )	Input current of the digital input.
Crosstalk	A measure of unwanted signal which is coupled through from one channel to another as a result of parasitic capacitance.
Off Isolation	A measure of unwanted signal coupling through an "OFF" channel.
Charge Injection	A measure of the glitch impulse transferred from the digital input to the analog output during switching.
$I_{DD}$	Positive supply current.
$I_{SS}$	Negative supply current.
