

4-TO-16 LINE DECODER/DEMULTIPLEXER WITH INPUT LATCHES

FEATURES

- Non-inverting outputs
- Output capability: standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT4514 are high-speed Si-gate CMOS devices and are pin compatible with "4514" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4514 are 4-to-16 line decoders/demultiplexers having four binary weighted address inputs (A_0 to A_3), with latches, a latch enable input (LE), and an active LOW enable input (E). The 16 outputs (Q_0 to Q_{15}) are mutually exclusive active HIGH. When LE is HIGH, the selected output is determined by the data on A_n . When LE goes LOW, the last data present at A_n are stored in the latches and the outputs remain stable. When E is LOW, the selected output, determined by the contents of the latch, is HIGH. At E HIGH, all outputs are LOW. The enable input (E) does not affect the state of the latch.

When the "4514" is used as a demultiplexer, E is the data input and A_0 to A_3 are the address inputs.

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t_{PHL}/t_{PLH}	propagation delay A_n to Q_n	$C_L = 15 \text{ pF}$ $V_{CC} = 5 \text{ V}$	23	26	ns
C_I	input capacitance		3.5	3.5	pF
C_{PD}	power dissipation capacitance per package	notes 1 and 2	44	45	pF

GND = 0 V; $T_{amb} = 25^\circ\text{C}$; $t_r = t_f = 6 \text{ ns}$

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$$
 where:

f_i = input frequency in MHz C_L = output load capacitance in pF

f_o = output frequency in MHz V_{CC} = supply voltage in V

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

2. For HC the condition is $V_I = \text{GND}$ to V_{CC}
For HCT the condition is $V_I = \text{GND}$ to $V_{CC} - 1.5 \text{ V}$
