DESCRIPTION

The 'FCT245 and 'FCT645 contain eight non-inverting bidirectional buffers with 3-state outputs and is intended for bus oriented applications. For the 'FCT245 and 'FCT645 current sinking capability is 64 mA at the A & B ports. The 'FCT245 and 'FCT645 are identical.

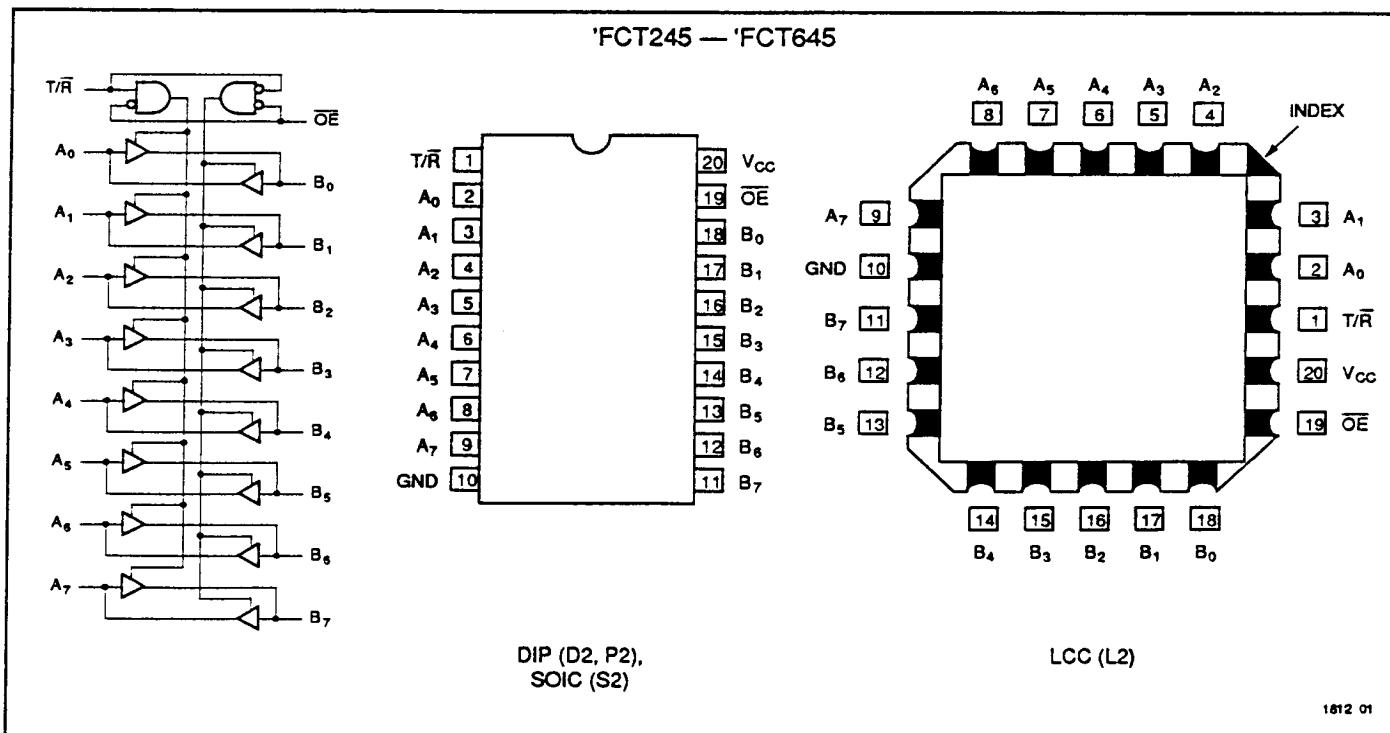

The Transmit/Receive (T/R) input determines the direction of data flow through the bidirectional transceiver. Transmit (Active HIGH) enables data from A ports to B ports; receive (Active LOW) enables data from B ports to A ports. The output enable input, when HIGH, disables both the A and B ports by putting them in a high Z condition.

Notes:

1. Typical limits are at $V_{CC} = 5.0\text{V}$, $T_A = +25^\circ\text{C}$ ambient.
 2. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect

operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

3. This parameter is guaranteed but not tested.
