DESCRIPTION

The P4C1298/L and P4C1299/L are 262,144-bit ultra high-speed static RAMs organized as 64K x 4. Each device features an active low Output Enable control to eliminate data bus contention. The P4C1298/L also have an active low Chip Enable (the P4C1299/L have two Chip Enables, both active low) for easy system expansion. The CMOS memories require no clocks or refreshing and have equal access and cycle times. Inputs are fully TTL-compatible. The RAMs operate from a single 5V $\pm$ 10% tolerance power supply. Data integrity is maintained with supply voltages down to 2.0V. Current drain is typically 10 μ A from a 2.0V supply.

Access times as fast as 20 nanoseconds are available, permitting greatly enhanced system operating speeds. CMOS is utilized to reduce power consumption to a low level in both active and standby modes. The P4C1298/L and P4C1299/L, are manufactured with PACE Technology™, and are members of a family of PACE RAM™ products offering super fast access times never before available at these complexity levels in TTL-compatible bipolar or CMOS technologies.

The P4C1298/L and P4C1299/L are available in 28-pin 300 mil DIP and SOJ, and 28-pin 350 x 550 mil LCC packages providing excellent board level densities.

Notes:

6. $\overline{CE}$ ($\overline{CE}_1$, $\overline{CE}_2$ for P4C1299/L) and $\overline{OE}$ are low READ cycle.
7. $\overline{OE}$ is low for the cycle.
8. ADDRESS must be valid prior to, or coincident with, $\overline{CE}$ ($\overline{CE}_1$ and $\overline{CE}_2$ for P4C1299/L) transition low.
9. Transition is measured $\pm 200\text{mV}$ from steady state voltage prior to change, with loading as specified in Figure 1.

10. Read Cycle Time is measured from the last valid address to the first transitioning address.

11. Transitions caused by a chip enable control have similar delays irrespective of whether $\overline{CE}_1$ or $\overline{CE}_2$ causes them (P4C1299/L).

12. $\overline{CE}_1$, $\overline{CE}_2$ for P4C1299/L.

13. $\overline{CE}$ ($\overline{CE}_1$, $\overline{CE}_2$ for P4C1299/L) and $\overline{WE}$ must be low for WRITE cycle.
 14. $\overline{OE}$ is low for this WRITE cycle.

15. If $\overline{CE}$ ($\overline{CE}_1$ or $\overline{CE}_2$ for P4C1299/L) goes high simultaneously with $\overline{WE}$ high, the output remains in a low impedance state.

16. Write Cycle Time is measured from the last valid address to the first transitioning address.

Note:

Due to the ultra-high speed of the P4C1298/L and P4C1299/L, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the V_{CC} and ground planes directly up to the contactor fingers. A 0.01 μ F high frequency capacitor is also required between

V_{CC} and ground. To avoid signal reflections, proper termination must be used; for example, a 50 Ω test environment should be terminated into a 50 Ω load with 1.73V (Thevenin Voltage) at the comparator input, and a 116 Ω resistor must be used in series with D_{OUT} to match 166 Ω (Thevenin Resistance).
