

PCMCIA Flash Memory Card 256KILOBYTE through 5 MEGABYTE (Intel based)

General Description

WEDC's FLG Series Flash memory cards offer low/medium density linear Flash solid state storage solutions for code and data storage, high performance disk emulation and execute in place (XIP) applications in mobile PC and dedicated (embedded) equipment.

FLG series cards conform to PCMCIA international standard.

The card's control logic provides the system interface and controls the internal Flash memories. Card can be read/written in byte-wide or word-wide mode which allows for flexible integration into various systems. Combined with file management software, such as Flash Translation Layer (FTL), FLG Flash cards provide removable high-performance disk emulation.

The FLG series cards contain separate 2kB EEPROM memory for Card Information Structure (CIS) which can be used for easy identification of card characteristics.

The WEDC FLG series is based on Intel 28F010 or 28F020 Flash memories.

Note: Standard options include attribute memory. Cards without attribute memory are available. Cards are also available with or without a hardware write protect switch.

Architecture Overview

WEDC's FLG series is designed to support from 2 to 20, 1Mb or 2MB components, providing a wide range of density options. Cards are based on the 28F010 (1Mb) or 28F020 components which work with 5V Vcc / 12V Vpp applications. Device codes are **B4h** and **BDh** respectively. Systems should be able to recognize both codes. Cards utilizing the 1Mb components provide densities ranging from 256KB to 2.5MB in 256KB increments, cards utilizing 2Mb components provide densities ranging from 512KB to 5MB in 512KB increments.

In support of the PC Card 95 standard for word wide access devices are paired. Write, read and erase operations can be performed as either a word or byte wide operation. By multiplexing A0, CE1# and CE2#, 8-bit hosts can access all data on data lines DQ0 - DQ7. The FLG series cards conform to the PC Card Standard (PCMCIA) and JEIDA, providing electrical and physical compatibility. The PC Card form factor offers an industry standard pinout and mechanical outline, allowing density upgrades without system design changes.

WEDC's standard cards are shipped with WEDC's Logo. Cards are also available with blank housings (no Logo). The blank housings are available in both a recessed (for label) and flat housing. Please contact WEDC sales representative for further information on Custom artwork.

Features

- Low cost Low/Medium Density Linear Flash Card
- Supports 5V systems with 12V VPP.
- Based on Intel CMOS Components
- Fast Read Performance
 - 150ns Maximum Access Time
- x8/ x16 Data Interface
- Quick-Pulse Programming Algorithm
 - typical 10µs Byte-Program
- 100,000 Erase/Program Cycles
- PC Card Standard Type I Form Factor

63	BVD1	O	Bat. Volt. Detect 1	(1)
64	DQ8	I/O	Data bit 8	
65	DQ9	I/O	Data bit 9	
66	DQ10	O	Data bit 10	
67	CD2#	O	Card Detect 2	LOW
68	GND		Ground	

Notes:

1. Wait#, BVD1 and BVD2 are driven high for compatibility
2. Shows density for which specified address bit is MSB. Higher order address bits are no connects (i.e. 4MB A21 is MSB A22 - A25 are NC).
3. For the 3MB card the memory will wrap at the 4MB boundary, for the 5MB card the memory will wrap at the 8MB boundary.

Mechanical

Card Signal Description

Symbol	Type	Name and Function
A0 - A25	INPUT	ADDRESS INPUTS: A0 through A25 enable direct addressing of up to 64MB of memory on the card. Signal A0 is not used in word access mode. The memory will wrap at the card density boundary (see PINOUT, note 3). The system should not try to access memory beyond the card density. A25 is the most significant bit. A23 – A25 are not connected.
DQ0 - DQ15	INPUT/OUTPUT	DATA INPUT/OUTPUT: DQ0 THROUGH DQ15 constitute the bi-directional databus. DQ0 – DQ7 constitute the lower (even) byte and DQ8 – DQ15 the upper (odd) byte. DQ15 is the MSB.
CE1#, CE2#	INPUT	CARD ENABLE 1 AND 2: CE1# enables even byte accesses, CE2# enables odd byte accesses. Multiplexing A0, CE1# and CE2# allows 8-bit hosts to access all data on DQ0 - DQ7.
OE#	INPUT	OUTPUT ENABLE: Active low signal gating read data from the memory card.
WE#	INPUT	WRITE ENABLE: Active low signal gating write data to the memory card.
RDY/BSY#	N.C.	READY/BUSY OUTPUT: Indicates status of internally timed erase or program algorithms. This signal is not connected.
CD1#, CD2#	OUTPUT	CARD DETECT 1 and 2: Provide card insertion detection. These signals are internally connected to ground on the card. The host shall monitor these signals to detect card insertion (pulled-up on host side).
WP	OUTPUT	WRITE PROTECT: Write protect reflects the status of the Write Protect switch on the memory card. WP set to high = write protected, providing internal hardware write lockout to the Flash array. If card does not include optional write protect switch, this signal will be pulled low internally indicating write protect = "off".
VPP1		PROGRAM/ERASE POWER SUPPLY: Provides programming voltages 12.0V for lower byte (D0 – D7) memory components.
VPP2		PROGRAM/ERASE POWER SUPPLY: Provides programming voltages 12.0V for upper byte (D8 – D15) memory components.
VCC		CARD POWER SUPPLY: (5.0V).
GND		CARD GROUND
REG#	INPUT	ATTRIBUTE MEMORY SELECT : Active low signal, enables access to Attribute Memory Plane, occupied by Card Information Structure and Card Registers.
RST	N.C.	RESET: Active high signal for placing cards in Power-on default state. This signal is not connected.
WAIT#	OUTPUT	WAIT: This signal is pulled high internally for compatibility. No wait states are generated.
BVD1, BVD2	OUTPUT	BATTERY VOLTAGE DETECT: These signals are pulled high to maintain SRAM card compatibility.
VS1, VS2	OUTPUT	VOLTAGE SENSE: Notifies the host socket of the card's VCC requirements. VS1 and VS2 are open to indicate a 5V card.
RFU		RESERVED FOR FUTURE USE
N.C.		NO INTERNAL CONNECTION TO CARD: pin may be driven or left floating

Odd-Byte Only Access	L	X	X

* Require proper programming voltages (Vpp1, Vpp2). Program or Erase with an invalid Vpp should not be attempted.

**Absolute Maximum Ratings** ⁽¹⁾

Operating Temperature TA (ambient)	
Commercial	0°C to +60 °C
Industrial	-40°C to +85 °C
Storage Temperature	
Commercial	-30°C to +80 °C
Industrial	-40°C to +85 °C
Voltage on any pin relative to VSS	-0.5V to VCC+0.5V
VCC supply Voltage relative to VSS	-0.5V to +7.0V

Note:

(1) Stress greater than those listed under "Absolute Maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation at these or any other conditions greater than those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC Characteristics ⁽¹⁾

Symbol	Parameter	Density	Notes	Typ ⁽³⁾	Max	Units	Test Conditions
I _{CCR}	VCC Read Current	All		10	30	mA	VCC = VCCmax tcycle = 150ns, CMOS levels
I _{CCW}	VCC Program Current	All	Vpp = 12V	1.0	10	mA	Programming in Progress
I _{PPW}	VPP Program Current	All		8.0	30	mA	Vpp=VppH Programming in Progress
I _{CCE}	VCC Erase Current	All	Vpp = 12V	5.0	15	mA	Erasure in Progress
I _{PPE}	VPP Erase Current	All		10	30	mA	Vpp=VppH Erasure in Progress
I _{CCS} (CMOS)	VCC Standby Current	256KB				μA	VCC = VCCmax Control Signals = VCC CMOS levels
		512KB		100			
		1MB					
		2MB					
		3MB					
		4MB					
		5MB					

CMOS Test Conditions: VCC = 5V ± 5%, VIL = VSS ± 0.2V, VIH = VCC ± 0.2V

Notes:

1. All currents are RMS values unless otherwise specified. ICCR, ICCW and ICCE are based on Byte wide operations. For 16 bit operation values are double.
2. Control Signals: CE₁#, CE₂#, OE#, WE#, REG#.
3. Typical: VCC = 5V, T = +25°C.

Symbol	Parameter	Notes	Min	Max	Units	Test Conditions
I _{LI}	Input Leakage Current	1		±1.0	μA	VCC = VCCMAX Vin = VCC or VSS
I _{LO}	Output Leakage Current	1		±10	μA	VCC = VCCMAX Vout = VCC or VSS
V _{IL}	Input Low Voltage	1	0	0.8	V	
V _{IH}	Input High Voltage	1	0.7VCC	VCC+0.5	V	
V _{OL}	Output Low Voltage	1		0.4	V	IOL = 3.2mA
V _{OH}	Output High Voltage	1	VCC-0.4	VCC	V	IOH = -2.0mA
V _{LKO}	VCC Erase/Program Lock Voltage	1	2.5		V	

Notes:

1. Values are the same for byte and word wide modes for all card densities.
2. Exceptions: Leakage currents on CE₁#, CE₂#, OE#, REG# and WE# will be < 500 μA when VIN = GND due to internal pull-up resistors.

AC Characteristics

Read Timing Parameters

SYMBOL (PCMCIA)	Parameter	150ns		200ns		Unit
		Min	Max	Min	Max	
$t_c(R)$	Read Cycle Time	150		200		ns
$t_a(A)$	Address Access Time		150		200	ns

$t_h(OE-WE)$	Output Enable Hold from WE#	10		10		ns
$t_{su}(CE)$	Card Enable Setup Time from OE#	0		0		ns
$t_h(CE)$	Card Enable Hold Time	20		20		ns

Note: AC timing diagrams and characteristics are guaranteed to meet or exceed PCMCIA 2.1 specifications.

Write Timing Diagram

Notes:

- Signal may be high or low in this area.
- When the data I/O pins are in the output state, no signals shall be applied to the data pins (D15 - D0) by the host system.

Data Write and Erase Performance

VCC = 5V ± 5%, Vpp1 = Vpp2=12.0V, T_A = 25°C

Parameter	Notes	Min	Typ ⁽¹⁾	Max	Units
Chip Program Time	28F010 1,2,4		2	12.5	sec
	28F020 1,2,4		4	25	
Chip Erase Time	28F010 1,3,4		1	10	sec
	28F020 1,3,4		2	30	

- Notes:
- 1. Typical: Nominal voltages and T_A = 25°C.
 - 2. Minimum byte programming time excluding system overhead is 16 μs (10μs program + 6μs write recovery), while maximum is 400μs/byte (16 μs x 25 loops allowed by algorithm). Max chip programming time is specified lower than the worst case allowed by the programming algorithm since most bytes program significantly faster than the worst case byte.
 - 3. Excludes 00H Programming prior to Erasure.
 - 4. Excludes System-Level Overhead.
