

54ACT/74ACT818 8-Bit Diagnostic Register

General Description

The 'ACT818 is a high-speed, general-purpose pipeline register with an on-board diagnostic register for performing serial diagnostics and/or writable control store loading.

The D-to-Y path provides an 8-bit parallel data path pipeline register for normal system operation. The diagnostic register can load parallel data to or from the pipeline register and can output data through the D input port (as in WCS loading).

The 8-bit diagnostic register has multiplexer inputs that select parallel inputs from the Y-port or adjacent bits in the diagnostic register to operate as a right-shift-only register. This register can then participate in a serial loop throughout the system where normal data, address, status and control registers are replaced with 'ACT818 diagnostic pipeline registers. The loop can be used to scan in a complete test routine starting point (Data, Address, etc.). Then after a specified number of machine cycles it scans out the results to be inspected for the expected results. WCS loading can be accomplished using the same technique. An instruction word can be serially shifted into the shadow register and written into the WCS RAM by enabling the D output.

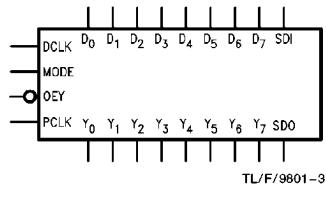

Features

- On-line and off-line system diagnostics
- Swaps the contents of diagnostic register and output register
- Diagnostic register and diagnostic testing
- Cascadable for wide control words as used in microprogramming
- Edge-triggered D registers
- Outputs source/sink 24 mA
- 'ACT818 has TTL-compatible inputs
- 'ACT818 is functionally- and pin-compatible to AMD Am29818 and MMI 74S818

Applications

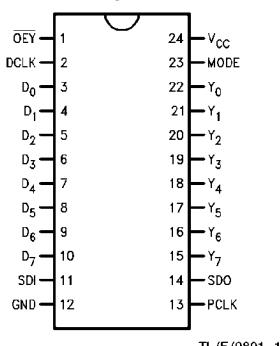

- Register for microprogram control store
- Status register
- Data register
- Instruction register
- Interrupt mask register
- Pipeline register
- General purpose register
- Parallel-serial/serial-parallel converter

Pin Names	Description
D ₀ -D ₇	Data Inputs
SDI	Serial Data Input
DCLK	Diagnostics Clock
MODE	Control Input
PCLK	Pipeline Register Clock
OEY	Output Enable Input
SDO	Serial Data Output
Y ₀ -Y ₇	Data Outputs

Diagnostic Register

TL/F/9801-4

Block Diagram

TL/F/9801-5

Functional Description

Data transfers into the diagnostic register occur on the LOW-to-HIGH transition of DCLK. Mode and SDI determine what data source will be loaded. The pipeline register is loaded on the LOW-to-HIGH transition of PCLK. Mode selects whether the data source is the data input or the diag-

nostic register output. Because of the independence of the clock inputs, data can be shifted in the diagnostic register via DCLK and loaded into the pipeline register from the data input via PCLK simultaneously, as long as no setup or hold times are violated. This simultaneous operation is legal.

Function Table

Inputs				Outputs			Operation
SDI	MODE	DCLK	PCLK	SDO	Diagnostic Reg.	Pipeline Reg.	
X	L	/	X	S7	SI < SI - 1, SO < SDI	NA	Serial Shift; D ₇ -D ₀ Disabled
X	L	X	/	S7	NA	PI < DI	Normal Load Pipeline Register
L	H	/	X	L	SI < YI	NA	Load Diagnostic Register from Y; DI Disabled
X	H	X	/	SDI	NA	PI < SI	Load Pipeline Register from Diagnostic Register
H	H	/	X	H	Hold	NA	Hold Diagnostic Register; DI Enabled

H = HIGH Voltage Level

L = LOW Voltage Level

X = Immaterial

/ = LOW-to-HIGH Clock Transition

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage (V_{CC})	−0.5V to + 7.0V
DC Input Diode Current (I_{IK}) $V_I = -0.5V$	−20 mA
$V_I = V_{CC} + 0.5V$	+20 mA
DC Input Voltage (V_I)	−0.5V to $V_{CC} + 0.5V$
DC Output Diode Current (I_{OK}) $V_O = -0.5V$	−20 mA
$V_O = V_{CC} + 0.5V$	+20 mA
DC Output Voltage (V_O)	−0.5V to $V_{CC} + 0.5V$
DC Output Source or Sink Current (I_O)	±50 mA
DC V_{CC} or Ground Current per Output Pin (I_{CC} or I_{GND})	±50 mA
Storage Temperature (T_{STG})	−65°C to + 150°C
Junction Temperature (T_J) CDIP PDIP	175°C 140°C

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. National does not recommend operation of FACT™ circuits outside databook specifications.

Recommended Operating Conditions

Supply Voltage (V_{CC}) 'ACT	4.5V to 5.5V
Input Voltage (V_I)	0V to V_{CC}
Output Voltage (V_O)	0V to V_{CC}
Operating Temperature (T_A) 74ACT 54ACT	−40°C to + 85°C −55°C to + 125°C
Minimum Input Edge Rate ($\Delta V/\Delta t$) 'ACT Devices V_{IN} from 0.8V to 2.0V $V_{CC} @ 4.5V, 5.5V$	125 mV/ns

Note: Plastic DIP packaging is not recommended for applications requiring greater than 3000 temperature cycles from 0°C to 125°C.

DC Characteristics for 'ACT Family Devices

Symbol	Parameter	V_{CC} (V)	74ACT		54ACT	74ACT	Units	Conditions
			$T_A = + 25^\circ C$		$T_A = -55^\circ C$ to + 125°C	$T_A = -40^\circ C$ to + 85°C
