

74ACQ273 • 54ACTQ/74ACTQ273 Quiet Series Octal D Flip-Flop

General Description

The 'AC/ACT273 has eight edge-triggered D-type flip-flops with individual D inputs and Q outputs. The common buffered Clock (CP) and Master Reset (\overline{MR}) input load and reset (clear) all flip-flops simultaneously.

The register is fully edge-triggered. The state of each D input, one setup time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output.

All outputs will be forced LOW independently of Clock or Data inputs by a LOW voltage level on the \overline{MR} input. The device is useful for applications where the true output only is required and the Clock and Master Reset are common to all storage elements.

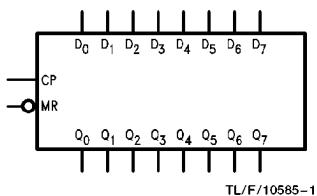

The 'ACQ/ACTQ utilizes NSC Quiet Series technology to guarantee quiet output switching and improved dynamic

threshold performance. FACT Quiet Series™ features GTOTM output control and undershoot corrector in addition to a split ground bus for superior performance.

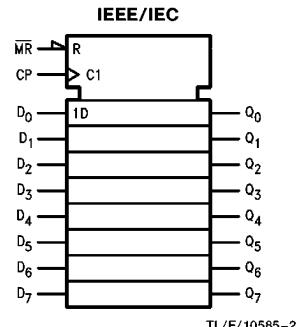

Features

- I_{CC} reduced by 50%
 - Guaranteed simultaneous switching noise level and dynamic threshold performance
 - Guaranteed pin-to-pin skew AC performance
 - Improved latch-up immunity
 - Buffered common clock and asynchronous master reset
 - Outputs source/sink 24 mA
 - Faster prop delays than the standard 'AC/ACT273
 - 4 kV minimum ESD immunity
 - Standard Military Drawing (SMD)
- 'ACTQ273: 5962-89735

Logic Symbols

TL/F/10585-1

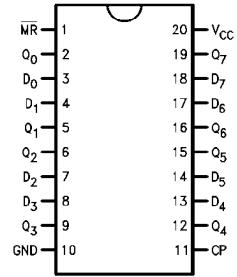

TL/F/10585-2

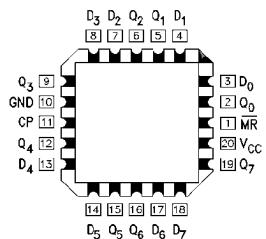

Pin Names	Description
D_0-D_7	Data Inputs
\overline{MR}	Master Reset
CP	Clock Pulse Input
Q_0-Q_7	Data Outputs

FACT™, FACT Quiet Series™, and GTOTM are trademarks of National Semiconductor Corporation.

Mode Select-Function Table

Operating Mode	Inputs			Outputs
	MR	CP	D _n	
Reset (Clear)	L	X	X	L
Load '1'	H	—	H	H
Load '0'	H	—	L	L

H = HIGH Voltage Level
 L = LOW Voltage Level
 X = Immaterial
 — = LOW-to-HIGH Transition

Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage (V_{CC})	-0.5V to + 7.0V
DC Input Diode Current (I_{IIK})	
$V_I = -0.5V$	-20 mA
$V_I = V_{CC} + 0.5V$	+20 mA
DC Input Voltage (V_I)	-0.5V to $V_{CC} + 0.5V$
DC Output Diode Current (I_{OK})	
$V_O = -0.5V$	-20 mA
$V_O = V_{CC} + 0.5V$	+20 mA
DC Output Voltage (V_O)	-0.5V to $V_{CC} + 0.5V$
DC Output Source or Sink Current (I_O)	±50 mA
DC V_{CC} or Ground Current per Output Pin (I_{CC} or I_{GND})	±50 mA
Storage Temperature (T_{STG})	-65°C to + 150°C
DC Latch-up Source or Sink Current	±300 mA
Junction Temperature (T_J)	
CDIP	175°C
PDIP	140°C

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. National does not recommend operation of FACT circuits outside databook specifications.

Recommended Operating Conditions

Supply Voltage (V_{CC})	'ACQ	2.0V to 6.0V
	'ACTQ	4.5V to 5.5V
Input Voltage (V_I)		0V to V_{CC}
Output Voltage (V_O)		0V to V_{CC}
Operating Temperature (T_A) (Note 2)		
	74ACQ/ACTQ	-40°C to + 85°C
	54ACTQ	-55°C to + 125°C
Minimum Input Edge Rate $\Delta V/\Delta t$		
'ACQ Devices		
V_{IN} from 30% to 70% of V_{CC}		
V_{CC} @ 3.0V, 4.5V, 5.5V		125 mV/ns
'ACTQ Devices		
V_{IN} from 0.8V to 2.0V		
V_{CC} @ 4.5V, 5.5V		125 mV/ns

Note: All commercial packaging is not recommended for applications requiring greater than 2000 temperature cycles from -40°C to +125°C.

DC Characteristics for 'ACQ Family Devices

Symbol	Parameter	V_{CC} (V)	74ACQ		74ACQ	Units	Conditions

C_{PD}	Power Dissipation Capacitance	40.0	pF	$V_{CC} = 5.0V$

FACT Noise Characteristics

The setup of a noise characteristics measurement is critical to the accuracy and repeatability of the tests. The following is a brief description of the setup used to measure the noise characteristics of FACT.

Equipment:

Hewlett Packard Model 8180A Word Generator
PC-163A Test Fixture
Tektronix Model 7854 Oscilloscope

Procedure:

- The setup of a noise characteristics measurement is critical to the accuracy and repeatability of the tests. The following is a brief description of the setup used to measure the noise characteristics of FACT.

Equipment:

 - Hewlett Packard Model 8180A Word Generator
 - PC-163A Test Fixture
 - Tektronics Model 7854 Oscilloscope

Procedure:

 1. Verify Test Fixture Loading: Standard Load 50 pF, 500Ω.
 2. Deskew the word generator so that no two channels have greater than 150 ps skew between them. This requires that the oscilloscope be deskewed first. Swap out the channels that have more than 150 ps of skew until all channels being used are within 150 ps. It is important to deskew the word generator channels before testing. This will ensure that the outputs switch simultaneously.
 3. Terminate all inputs and outputs to ensure proper loading of the outputs and that the input levels are at the correct voltage.
 4. Set V_{CC} to 5.0V.
 5. Set the word generator to toggle all but one output at a frequency of 1 MHz. Greater frequencies will increase DUT heating and affect the results of the measurement.

FIGURE 1. Quiet Output Noise Voltage Waveforms

Note A. V_{OHV} and V_{OLP} are measured with respect to ground reference.

Note B. Input pulses have the following characteristics: $f = 1$ MHz, $t_r = 3$ ns, $t_f = 3$ ns, skew < 150 ps.

 6. Set the word generator input levels at 0V LOW and 3V HIGH for ACT devices and 0V LOW and 5V HIGH for AC devices. Verify levels with a digital volt meter.

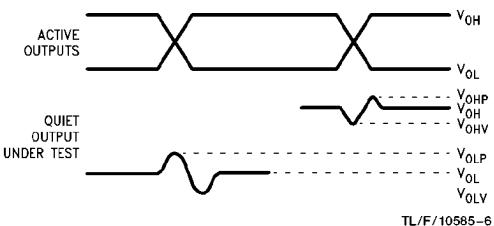

FIGURE 1. Quiet Output Noise Voltage Waveforms

Note A: V_{0H} and V_{0P} are measured with respect to ground reference.

Note B. Input pulses have the following characteristics: $f = 1 \text{ MHz}$, $t_r = 3 \text{ ns}$, $t_f = 3 \text{ ns}$, skew < 150 ps.

6. Set the word generator input levels at 0V LOW and 3V HIGH for ACT devices and 0V LOW and 5V HIGH for AC devices. Verify levels with a digital volt meter.

FACT Noise Characteristics (Continued)

V_{OLP}/V_{OLV} and V_{OHP}/V_{OHV} :

- Determine the quiet output pin that demonstrates the greatest noise levels. The worst case pin will usually be the furthest from the ground pin. Monitor the output voltages using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- Measure V_{OLP} and V_{OLV} on the quiet output during the HL transition. Measure V_{OHP} and V_{OHV} on the quiet output during the LH transition.
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

V_{ILD} and V_{IHD} :

- Monitor one of the switching outputs using a 50Ω coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.

- First increase the input LOW voltage level, V_{IL} , until the output begins to oscillate. Oscillation is defined as noise on the output LOW level that exceeds V_{IL} limits, or on output HIGH levels that exceed V_{IH} limits. The input LOW voltage level at which oscillation occurs is defined as V_{ILD} .
- Next increase the input HIGH voltage level on the word generator, V_{IH} until the output begins to oscillate. Oscillation is defined as noise on the output LOW level that exceeds V_{IL} limits, or on output HIGH levels that exceed V_{IH} limits. The input HIGH voltage level at which oscillation occurs is defined as V_{IHD} .
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
