LS353

54LS353/DM74LS353 Dual 4-Input Multiplexer with TRI-STATE® Outputs

General Description

The '353 is a dual 4-input multiplexer with TRI-STATE outputs. It can select two bits of data from four sources using common select inputs. The outputs may be individually switched to a high impedance state with a HIGH on the respective Output (\overline{OE}) inputs, allowing the outputs to interface directly with bus oriented systems. It is fabricated with the Schottky barrier diode process for high speed and is completely compatible with all National TTL families.

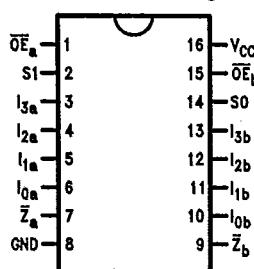

Features

- Inverted version of 'LS253
- Schottky process for high speed
- Multifunction capability

Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.	
Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	
54LS	-55°C to +125°C
DM74LS	0°C to +70°C
Storage Temperature Range	-65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Functional Description

The 'LS353 contains two identical 4-input multiplexers with TRI-STATE outputs. They select two bits from four sources selected by common Select Inputs (S_0 , S_1). The 4-input multiplexers have individual Output Enable (\bar{OE}_a , \bar{OE}_b) inputs which when HIGH, force the outputs to a high impedance (high Z) state. The logic equations for the outputs are shown below:

$$\bar{Z}_a = \bar{OE}_a \cdot (I_{0a} \cdot \bar{S}_1 \cdot \bar{S}_0 + I_{1a} \cdot \bar{S}_1 \cdot S_0 + I_{2a} \cdot S_1 \cdot \bar{S}_0 + I_{3a} \cdot S_1 \cdot S_0)$$

$$\bar{Z}_b = \bar{OE}_b \cdot (I_{0b} \cdot \bar{S}_1 \cdot \bar{S}_0 + I_{1b} \cdot \bar{S}_1 \cdot S_0 + I_{2b} \cdot S_1 \cdot \bar{S}_0 + I_{3b} \cdot S_1 \cdot S_0)$$

If the outputs of TRI-STATE devices are tied together, all but one device must be in the high impedance state to avoid high currents that would exceed the maximum ratings. Designers should ensure that Output Enable signals to TRI-STATE devices whose outputs are tied together are designed so that there is no overlap.

Truth Table

Select Inputs	Data Inputs				Output Enable	Output	
S_0	S_1	I_0	I_1	I_2	I_3	\bar{OE}	\bar{Z}
