Dual J-K Flip-Flop with Set and Reset

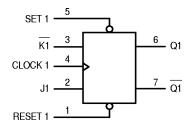

High-Performance Silicon-Gate CMOS

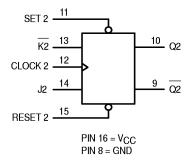

The MC74HC109 is identical in pinout to the LS109. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs. $_$

This device consists of two J–K flip–flops with individual set, reset, and clock inputs. Changes at the inputs are reflected at the outputs with the next low–to–high transition of the clock. Both Q and Q outputs are available from each flip–flop.

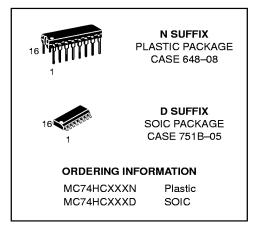

- Output Drive Capability: 10 LSTTL Loads
- · Outputs Directly Interface to CMOS, NMOS, and TTL
- . Operating Voltage Range: 2 to 6 V
- Low Input Current: 1 μA
- · High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard
 No. 7A
- Chip Complexity: 148 FETs or 37 Equivalent Gates

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND \leq (V_{in} or V_{out}) \leq V_{CC} . Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

SOIC Package: - 7 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2 of the Motorola High-Speed CMOS Data Book (DL129/D).
