

16-Bit A/D Converter - Radiation Hardened 5016RP

Self-Calibrating
High Speed CMOS

For Space Applications

SEI's 5016RP (RP for RAD-PAK®) high speed CMOS microcircuit features a minimum 100 kilorad(Si) total dose tolerance. Fully equivalent to the commercial 5016, the 5016RP combines Crystal Semiconductor's advanced

CMOS process and SEI's radiation hardened RAD-PAK® packaging. This device offers a unique self-calibration circuitry which insures excellent linearity and differential nonlinearity, with no missing codes. Offset and full scale errors are kept within 1 LSB, which helps eliminate the need for calibration. Unipolar and bipolar input ranges are digitally selectable. Capable of surviving space environments, the 5016RP is ideal for satellite, spacecraft, and space probe missions. The patented RAD-PAK® technology incorporates radiation shielding in the microcircuit package. It eliminates box shielding while providing lifetime in orbit. The 5016RP, capable of operational sample rates up to 50kHz, features the same system performance and architecture as the commercial Crystal Semiconductor's counterpart. It is available in Class S packaging and screening.

1. $+V_A, +V_D = +5.0V$; $-V_A, -V_D = -5.0V$; $V_{REF} = +4.5V$ dc; $f_{CLK} = 4MHz$; analog source impedance = 200Ω ; error tests are done after calibration at the temperature of interest.
2. Synchronous sampling mode (EOT\ connected to HOLD\), interleave disabled.
3. This parameter shall be measured only for initial characterization and after process or design changes which may affect this parameter.
4. Total drift over $-55^\circ C$ to $+125^\circ C$ since calibration at power-up at $+25^\circ C$.
5. $+V_A, +V_D = +5.0V$ dc $\pm 10\%$; $-V_A, -V_D = -5.0V$ dc $\pm 10\%$.
6. This parameter is guaranteed, if not tested, at $T_A = +25^\circ C$. This parameter is tested at $T_A = -55^\circ C$ and $125^\circ C$.
7. Measured from falling transition on HOLD\ to falling transition on EOC\.
8. Acquisition time is the time allowed by the converter for acquisition of the input voltage prior to conversion.
9. All outputs unloaded; all inputs swinging between $+V_D$ and $0V$ dc.
10. Externally supplied maximum clock frequency is $4MHz$. Analog parametric measurements are done with the maximum external clock (See 1 above).
11. Inputs: logic "0" = $0V$, logic "1" = $+V_D$; $C_L = 50pF$.
